## **Certificate of Volatility**

Manufacturer: Xerox

Equipment Name: Copy Centre

Model: 32c, 40c

Configuration: This item is standalone

General description: Standalone color copier.

Purpose: Standalone Color Copier

Type of memory:

**Volatile memory**: What is the amount? What period of time does the unit need to be powered off to completely erase this memory?

## **User Interface Volatile memory:**

DRAM: 8 MB Flash ROM: 8 MB

### Marking Engine Volatile memory:

EPC DRAM: 256-512 MB Flash ROM 16 MB S2X RAM 64-256 MB

# **Scanner Volatile Memory:**

SRAM: 128 KB

DADF firmware: 8 KB (DADF=Digital Automatic Document Feeder)

### Other Memory Devices

There are other memory devices in the multi-functional device, but these are used solely for low-level I/O control. Some examples of this distributed control are:

- · Power distribution, Photoreceptor and main drive motors control
- · Raster Output Scanner (ROS)
- · Paper Registration
- · Finisher

No user image data is stored in any of these memory devices.

#### **Video Volatile Memory:**

There are also a number of RAM buffers in the video path that are used for image manipulation (Reduce/Enlarge, etc.), and all have no data retention capability. When power is removed all data is lost. These buffers are typically built into the ASICs.

Typical bleed down time for all volatile memory is 10 seconds.

## **Non-Volatile Memory:**

1. **Type:** What type(s) of non-volatile memory are included, EPROM, EEPROM, Flash memory, NVRAM, and battery backed, etc. (fill in)

## **Marking Engine Non-Volatile Memory:**

NVRAM 32 KB / 128 KB, battery back-up

2. **Accessibility:** Is it accessible by accidental/intentional keystroke, or software malfunction? **No.** However, the login system administrator or service technician (via diagnostic operation) may adjust certain machine operational parameters. User data is never accessible.

If "YES, it is accessible, describe location and purpose.

If "NO", it is not accessible, \_\_\_\_X\_\_ (Check here).

3. Required memory: Is device needed for normal operation, i.e. required for this processing period?

All memory listed is required for normal operation.

4. *Removal consequences:* If device memory chip is erased, what impact will this have on operation and normal function of device?

ROM/PROM memory device content is required and essential for operation and normal function of the device. Loss would render the device inoperable.

ROM/PROM memory, as stated above, never contains user data. This memory is never overwritten or erased during normal operation.

DRAM/SRAM memory processes user data. DRAM/SRAM is overwritten with test data at each power off and power on cycle.

5. *Method of access:* How is it accessed? Is non-volatile memory location theoretically accessible with any system code, not just via the operating system or low level booting firmware?

Marking Engine non-volatile memory is used for storing Multifunction Device application settings and is accessible by application level code.

- 6. *Warranty:* Does chip removal or EEPROM erasure void the warranty? Yes, chip removal or EEPROM erasure will void the warranty.
- 7. *Size:* How much memory is contained? Number of bytes, etc. See page 1, "Type of Memory"
- 8. *Spacing:* Is the memory fully utilized or does it have available memory space for additional information to be placed?

The non-volatile memory devices are sized to contain the necessary amount of data required for system operation. Usually there are some unused memory addresses where additional information could be theoretically stored. Without access to the software developers' memory maps, determining the location of this unused memory would require reverse engineering the software.

9. Can this non-volatile memory be addressed to ensure that only authorized information is resident? If yes, how?

At boot-up, the system computes a checksum for each non-volatile memory device. (Note: The computed checksum is compared against a value stored in the device itself. This is sufficient to detect hardware failures, but not necessarily intentional corruption.)

Evaluation and summary of this equipment was completed by the following:
