1. ST INTRODUCTION

This chapter describes Security Target (ST) Reference, TOE Reference, TOE Overview, and TOE Description.

1.1. ST Reference

This section provides information needed to identify this ST.

<table>
<thead>
<tr>
<th>ST Title:</th>
<th>Xerox PrimeLink B9110/B9125/B9136 Copier/Printer Security Target</th>
</tr>
</thead>
<tbody>
<tr>
<td>ST Version:</td>
<td>V 1.07</td>
</tr>
<tr>
<td>Publication Date:</td>
<td>June 26, 2020</td>
</tr>
<tr>
<td>Author:</td>
<td>Fuji Xerox Co., Ltd.</td>
</tr>
</tbody>
</table>

1.2. TOE Reference

This section provides information needed to identify the TOE.

<table>
<thead>
<tr>
<th>TOE Identification:</th>
<th>Xerox PrimeLink B9110/B9125/B9136 Copier/Printer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version:</td>
<td>Controller+PS ROM: Ver. 1.1.4</td>
</tr>
</tbody>
</table>

The TOE is the one of the following MFDs and identified by the following Display name displayed in the control panel or setting report.

<table>
<thead>
<tr>
<th>MFD</th>
<th>Display name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Xerox PrimeLink B9110 Copier/Printer</td>
<td>Xerox PrimeLink B9110</td>
</tr>
<tr>

<td>Xerox PrimeLink B9125</td>
</tr>
<tr>
<td>Xerox PrimeLink B9136 Copier/Printer</td>
<td>Xerox PrimeLink B9136</td>
</tr>
</tbody>
</table>
1.3. TOE Overview

1.3.1. TOE Type

The TOE is an MFD that is connected to a Wired Local Area Network (LAN) and supports the copy, scan, print, and document storage and retrieval functions.

1.3.2. Usage and Major Security Features of TOE

The MFD is used in an environment that is connected to a Wired Local Area Network (LAN) isolated from the external network by the firewall.

Figure 1 Operational Environment Assumed by TOE
Users use each basic function of the MFD from the control panel of the MFD or web browser or printer driver of the general user and system administrator clients. The MFD has the functions to copy, scan, print, store and retrieve the documents handled by users. To prevent alteration and leakage of these documents, the MFD has the functions to identify and authenticate users, control access to documents and functions based on user roles, encrypt the setting data and document data stored in MFD storage, protect the communication data on the LAN, manage security settings (available only to system administrators), store the usage history of the security functions of the MFD in the MFD internally and monitor the usage history from an external audit server at the same time (security audit function), verify the integrity of the TSF executable code and TSF data, verify the authenticity of the TSF executable code when the code is updated, and overwrite image data stored in the storage.

The products that are included in the TOE support local authentication and remote authentication. However, only local authentication is used in the settings of the TOE.

Note:
- There are two types of Mailboxes: the Personal Mailbox, which SAs and general users can create, and the Shared Mailbox, which the Key Operator can create. The guidance of the TOE prohibits the use of the Shared Mailbox. In this ST, "Mailbox" means "Personal Mailbox."

1.3.3. Required Non-TOE Hardware and Software

In the operational environment shown in Figure 1, the TOE is an MFD, and there are the following non-TOE hardware and software.

(1) General user client
   - The hardware is a general-purpose computer.
   - When the computer is used as a printer client, the user needs to install a printer driver on the computer so that a request to print document data can be sent to the MFD.
   - In order to use the web server function of the MFD, the user needs to use a web browser installed on the computer.

(2) System administrator client
   - The hardware is a general-purpose computer.
   - A web browser is necessary for a system administrator to refer to and change the TOE settings and update the TOE firmware.

(3) Mail server
   - A mail server is necessary for the MFD to send scanned documents via email. The hardware/OS of the server is a general-purpose computer/server, and an email service that supports the SMTP protocol protected by TLS needs to be installed.
(4) Audit server

An audit server is necessary to collect audit events occurred on the MFD. The hardware/OS is a
general-purpose computer/server, and the MFD sends security audit logs to the audit server using
HTTPS on the request of the audit server.

In the TOE evaluation, the following shall be used as the hardware and software listed above.
The OS and web browser for (1) general user client and (2) system administrator client shall be
Windows 10 and Microsoft Edge respectively.
(3) mail server shall be Postfix version 2.10.1.
The OS of (4) audit server shall be Windows 10, and the execution environment to retrieve logs
shall be PowerShell version 5.1. The system administrator needs to create a PowerShell script for
log retrieval in accordance with the guidance and install it on the server.
The printer driver used in (1) general user client shall be either of the following printer drivers,
which Xerox Corporation offers for the target MFD models.
“V3 Xerox Global Print Driver PostScript”
1.4. TOE Description

This section describes user roles and the logical and physical boundaries of the TOE.

1.4.1. Users Assumptions

Table 1 specifies the TOE user roles assumed in this ST.

<table>
<thead>
<tr>
<th>Name</th>
<th>User data type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>U.NORMAL</td>
<td>General user</td>
<td>An identified and authorized User who is not granted the administrative role.</td>
</tr>
<tr>
<td>U.ADMIN</td>
<td>System administrator</td>
<td>An identified and authorized User who is granted the administrative role.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(In the TOE, the Key Operator and SAs are U.ADMIN. They are collectively referred to as U.ADMIN in this ST.)</td>
</tr>
</tbody>
</table>
1.4.2. Logical Scope and Boundary

Figure 2 shows the logical architecture of the TOE. Among the functions within the logical boundary, the ones without underlines are basic functions and the ones with underlines are security functions.

![Logical Boundary Diagram]

1.4.2.1. Basic Functions

(1) Print: The MFD receives a digital document sent from the general user client. The received document is converted into a hard copy in accordance with the request from the control panel.

(2) Scan: The MFD scans the document on the scanner in accordance with the request from the control panel and converts the document into a digital document. The TOE has the function to send digital documents converted from paper documents by the scan function.
to the mail server and the function to store these documents in Mailboxes using the
document storage and retrieval function.

(3) Copy: The MFD copies the document on the scanner in accordance with the request from
the control panel.

(4) Store File: The MFD scans the document on the scanner in accordance with the request
from the control panel and converts the document into a digital document. The converted
documents are stored in Mailboxes by “Document storage and retrieval” function.
(In terms of converting a hard copy document on the scanner into a digital document,
“Store File” function is equivalent to “Scan” function defined in HCD-PP.)

(5) Document storage and retrieval: The MFD stores digital documents in Mailboxes and
enables the following functions for stored documents in response to requests sent from the
control panel or general user clients. In the TOE, digital documents that can be stored in a
Mailbox are scanned documents with the scan function or store file function.
Print: Print a digital document stored in Mailbox in accordance with the request from the
control panel or general user clients.
Retrieve: Send documents to general user clients in response to requests sent from general
user clients. In the case of documents scanned by “Store File”, users can not request
retrieval operation for the documents from general user clients.
Delete: Delete stored digital documents in accordance with the request from the control
panel or general user clients.
Edit: Only for digital documents scanned by “Store File”, edit pages, merge, etc. for stored
digital documents in Mailboxes in accordance with the request from the control panel.

1.4.2.2, Security Functions

The TOE provides the following security functions to support the basic functions described in
1.4.2.1.

(1) Identification and Authentication
Identifying/authenticating users and granting roles to the users ensure that functions of
the MFD are accessible only to users who have been granted roles by a system
administrator. The user identification and authentication function are also used as the
basis for access control and administrative roles and helps associate specific users with
security-relevant events and records of MFD use. The MFD carries out the identification
and authentication of users.
When a user attempts to be authenticated and fails consecutively multiple times, another
request to authenticate the user is no longer accepted.
The products that are included in the TOE supports local authentication and remote
authentication, but only local authentication is selected in the TOE settings.

(2) Access Control
Access control ensures that documents, information related to document processing, and
security-relevant data are accessible only to users who have appropriate access
permissions.

(3) Data Encryption
Data encryption ensures that the data and communications data stored in the TOE
cannot be accessed by an attacker through an unauthorized interface.
- Depending on the policy, data encryption is also used to protect documents and
  confidential system information on field-replaceable nonvolatile storage devices and to
  protect such data when these devices are removed from the MFD.
- The effectiveness of data encryption is assured through the use of internationally
  accepted cryptographic algorithms.

(4) Trusted Communications
Trusted communications protect communication data on an internal network, such as
document data, job information, security audit log data, and TOE setting data.
The TOE supports general encrypted communication protocols (TLS/HTTPS and TLS).

(5) Security Management
The security management function ensures that only users who have been identified and
authenticated as system administrators can refer to or change the settings of security
functions of the TOE from the control panel or system administrator client.

(6) Security Audit
Information about when and who carried out which actions and important events, such as
device failure, configuration change, and user operation, are transferred to the audit
server and stored as security audit log data. The security audit log data is encrypted by
the HTTPS protocol when being transferred.
The history of audit log data is stored in the TOE internally, only authorized users as a
system administrator can also download it from a web browser of a system administrator
client.

(7) Trusted Operation
Firmware updates for the MFD are verified before being applied to ensure the
authenticity of the software. The MFD performs self-tests to ensure that its operation is
not disrupted by some detectable malfunctions.

(8) Overwrite Hard Disk
Used document data stored in the internal storage is overwritten after any of functions,
such as copy, print, and scan, is completed. The MFD also provides “On Demand
Overwrite” function that deletes stored documents and overwrites them by specifying the
time or manually.

1.4.3. Physical Scope and Boundary
The physical boundary of the TOE is the whole MFD. The TOE does not include options and add-
ones that are not relevant to security, such as finishers. Physical components that constitute the
TOE are listed in Tables 2 to 3.
One of the MFD units in Table 2 and the guidances in Table 3 constitutes the TOE.
MFD unit is identified by the following Display name displayed in the control panel after start-up
and setting report.
The interfaces for users to connect personal storage devices (portable flash memory devices, etc.)
to the MFD are disabled.

2. CONFORMANCE CLAIM

2.1. CC Conformance Claim
This ST and TOE claim conformance to the following versions of CC:

Common Criteria for Information Technology Security Evaluation
Part 1: Introduction and general model (April 2017 Version 3.1 Revision 5)
Part 2: Security functional components (April 2017 Version 3.1 Revision 5)
Part 3: Security assurance components (April 2017 Version 3.1 Revision 5)

CC Part 2 extended
CC Part 3 conformant

2.2. PP claim, Package Claim

2.2.1. PP Claim
This ST claims exact conformance to the following HCD-PP.

Title: Protection Profile for Hardcopy Devices
Version: 1.0 dated September 10, 2015
Errata: Protection Profile for Hardcopy Devices – v1.0 Errata #1, June 2017

2.2.2. Package Claim
This Security Target and TOE do not claim package conformance.

2.2.3. Conformance Rationale
This ST and TOE satisfy the conditions required by the PP.
The TOE type conforms to the PP because this ST and TOE satisfy the following conditions required by the PP and claim exact conformance to the PP.

- Required Uses
  Printing, scanning, copying, network communications, administration

- Conditionally Mandatory Uses
  Storage and retrieval, field-replaceable nonvolatile storage.

- Optional Uses
  Internal audit log storage, image overwrite
3. SECURITY PROBLEM DEFINITION

This chapter describes the threats, organizational security policies, and the assumptions for the use of the TOE.

3.1. Threats

3.1.1. Assets Protected by TOE

The TOE protects the following assets.

<table>
<thead>
<tr>
<th>Designation</th>
<th>User Data type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>D.USER.DOC</td>
<td>User Document Data</td>
<td>Information contained in a User’s Document, in electronic or hardcopy form</td>
</tr>
<tr>
<td>D.USER.JOB</td>
<td>User Job Data</td>
<td>Information related to a User’s Document or Document Processing Job</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Designation</th>
<th>TSF Data type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>D.TSF.Prot</td>
<td>Protected TSF Data</td>
<td>TSF Data for which alteration by a User who is neither the data owner nor in an Administrator role might affect the security of the TOE, but for which disclosure is acceptable</td>
</tr>
<tr>
<td>D.TSF.Conf</td>
<td>Confidential TSF Data</td>
<td>TSF Data for which either disclosure or alteration by a User who is neither the data owner nor in an Administrator role might affect the security of the TOE</td>
</tr>
</tbody>
</table>

3.1.2. Threats

Table 6 identifies the threats addressed by the TOE.

<table>
<thead>
<tr>
<th>Designation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>T.UNAUTHORIZED_ACCESS</td>
<td>An attacker may access (read, modify, or delete) User Document Data or change (modify or delete) User Job Data in the TOE through one of the TOE’s interfaces.</td>
</tr>
<tr>
<td>T.TSF_COMPROMISE</td>
<td>An attacker may gain Unauthorized Access to TSF Data in the TOE through one of the TOE’s interfaces.</td>
</tr>
</tbody>
</table>
3.2. Organizational Security Policies

Table 7 describes the organizational security policies the TOE must comply with.

<table>
<thead>
<tr>
<th>Designation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>P.AUTHORIZATION</td>
<td>Users must be authorized before performing Document Processing and administrative functions.</td>
</tr>
<tr>
<td>P.AUDIT</td>
<td>Security-relevant activities must be audited, and the log of such actions must be protected and transmitted to an External IT Entity.</td>
</tr>
<tr>
<td>P.COMMS_PROTECTION</td>
<td>The TOE must be able to identify itself to other devices on the LAN.</td>
</tr>
<tr>
<td>P.STORAGE_ENCRYPTION</td>
<td>If the TOE stores User Document Data or Confidential TSF Data on Field-Replaceable Nonvolatile Storage Devices, it will encrypt such data on those devices.</td>
</tr>
<tr>
<td>(conditionally mandatory)</td>
<td></td>
</tr>
<tr>
<td>P.KEY_MATERIAL</td>
<td>Cleartext keys, submasks, random numbers, or any other values that contribute to the creation of encryption keys for Field-Replaceable Nonvolatile Storage of User Document Data or Confidential TSF Data must be protected from unauthorized access and must not be stored on that storage device.</td>
</tr>
<tr>
<td>(conditionally mandatory)</td>
<td></td>
</tr>
<tr>
<td>P.IMAGE_OVERWRITE</td>
<td>Upon completion or cancellation of a Document Processing job, the TOE shall overwrite residual image data from its Field-Replaceable Nonvolatile Storage Devices.</td>
</tr>
</tbody>
</table>
3.3. Assumptions

Table 8 describes the assumptions for the performance, operation, and use of the TOE.

<table>
<thead>
<tr>
<th>Designation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.PHYSICAL</td>
<td>Physical security, commensurate with the value of the TOE and the data it stores or processes, is assumed to be provided by the environment.</td>
</tr>
<tr>
<td>A.NETWORK</td>
<td>The Operational Environment is assumed to protect the TOE from direct, public access to its LAN interface.</td>
</tr>
<tr>
<td>A.TRUSTED_ADMIN</td>
<td>TOE Administrators are trusted to administer the TOE according to site security policies.</td>
</tr>
<tr>
<td>A.TRAINED_USERS</td>
<td>Authorized Users are trained to use the TOE according to site security policies.</td>
</tr>
</tbody>
</table>
4. Security Objectives

This chapter describes the security objectives for the environment. Table 9 defines the security objectives for the TOE environment.

Table 9 Security Objectives for the TOE Environment

<table>
<thead>
<tr>
<th>Designation</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>OE PHYSICAL PROTECTION</td>
<td>The Operational Environment shall provide physical security, commensurate with the value of the TOE and the data it stores or processes.</td>
</tr>
<tr>
<td>OE NETWORK PROTECTION</td>
<td>The Operational Environment shall provide network security to protect the TOE from direct, public access to its LAN interface.</td>
</tr>
<tr>
<td>OE ADMIN TRUST</td>
<td>The TOE Owner shall establish trust that Administrators will not use their privileges for malicious purposes.</td>
</tr>
<tr>
<td>OE USER TRAINING</td>
<td>The TOE Owner shall ensure that Users are aware of site security policies and have the competence to follow them.</td>
</tr>
<tr>
<td>OE ADMIN TRAINING</td>
<td>The TOE Owner shall ensure that Administrators are aware of site security policies and have the competence to use manufacturer’s guidance to correctly configure the TOE and protect passwords and keys accordingly.</td>
</tr>
</tbody>
</table>
5. EXTENDED COMPONENTS DEFINITION

Extended components in this section are defined in HCD-PP.

5.1. Extended Functional Requirements Definition

5.1.1. Class FAU: Security Audit

FAU_STG_EXT Extended: External Audit Trail Storage

Family Behavior:
This family defines requirements for the TSF to ensure that secure transmission of audit data from TOE to an External IT Entity.

Component leveling:

| FAU_STG_EXT.1 | Extended: External Audit Trail Storage interfaces | 1 |

FAU_STG_EXT.1 External Audit Trail Storage requires the TSF to use a trusted channel implementing a secure protocol.

Management:
The following actions could be considered for the management functions in FMT:
- The TSF shall have the ability to configure the cryptographic functionality.

Audit:
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:
- There are no auditable events foreseen.

FAU_STG_EXT.1 Protected Audit Trail Storage

Hierarchical to: No other components.
Dependencies: FAU_GEN.1 Audit data generation, FTP_ITC.1 Inter-TSF trusted channel

FAU_STG_EXT.1.1 The TSF shall be able to transmit the generated audit data to an External IT Entity using a trusted channel according to FTP_ITC.1.

Rationale:
The TSF is required that the transmission of generated audit data to an External IT Entity which relies on a non-TOE audit server for storage and review of audit records. The storage of these audit records and the ability to allow the administrator to review these audit records is provided by the Operational Environment in that case. The Common Criteria does not provide a suitable SFR for the transmission of audit data to an External IT Entity.
This extended component protects the audit records, and it is therefore placed in the FAU class with a single component.

5.1.2. Class FCS: Cryptographic Support

FCS_CKM_EXT Extended: Cryptographic Key Management

Family Behavior:
This family addresses the management aspects of cryptographic keys. Especially, this extended component is intended for cryptographic key destruction.

Component leveling:

| FCS_CKM_EXT.4 Extended: Cryptographic Key Material Destruction | 4 |

FCS_CKM_EXT.4 Cryptographic Key Material Destruction ensures not only keys but also key materials that are no longer needed are destroyed by using an approved method.

Management:
The following actions could be considered for the management functions in FMT:
- There are no management actions foreseen.

Audit:
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:
- There are no auditable events foreseen.

FCS_CKM_EXT.4 Cryptographic Key Material Destruction

Hierarchical to: No other components.

Dependencies: FCS_CKM.1(a) Cryptographic Key Generation (for asymmetric keys), or FCS_CKM.1(b) Cryptographic key generation

(Symmetric Keys), FCS_CKM.4 Cryptographic key destruction

FCS_CKM_EXT.4.1 The TSF shall destroy all plaintext secret and private cryptographic keys and cryptographic critical security parameters when no longer needed.

Rationale:
Cryptographic Key Material Destruction is to ensure the keys and key materials that are no longer needed are destroyed by using an approved method, and the Common Criteria does not provide a suitable SFR for the Cryptographic Key Material Destruction.
This extended component protects the cryptographic key and key materials against exposure, and it is therefore placed in the FCS class with a single component.

**FCS_HTTPS_EXT Extended: HTTPS selected**

**Family Behavior:**
Components in this family define requirements for protecting remote management sessions between the TOE and a Security Administrator. This family describes how HTTPS will be implemented. This is a new family defined for the FCS Class.

**Component leveling:**

<table>
<thead>
<tr>
<th>FCS_HTTPS_EXT.1 Extended: HTTPS selected</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destruction interfaces</td>
<td></td>
</tr>
</tbody>
</table>

**FCS_HTTPS_EXT.1 HTTPS selected, requires that HTTPS be implemented according to RFC 2818 and supports TLS.**

**Management:**
The following actions could be considered for the management functions in FMT:
- There are no management actions foreseen.

**Audit:**
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:
- Failure of HTTPS session establishment

**FCS_HTTPS_EXT.1 HTTPS selected**

Hierarchical to: No other components.

Dependencies: No dependencies.

**FCS_HTTPS_EXT.1.1** The TSF shall implement the HTTPS protocol that complies with RFC 2818.

**FCS_HTTPS_EXT.1.2** The TSF shall implement HTTPS using TLS as specified in FCS_HTTPS_EXT.1.

**Rationale:**
HTTPS is one of the secure communication protocols, and the Common Criteria does not provide a suitable SFR for the communication protocols using cryptographic algorithms.

This extended component protects the communication data using cryptographic algorithms, and it is therefore placed in the FCS class with a single component.

**FCS_KYC_EXT Extended: Cryptographic Operation (Key Chaining)**
Family Behavior:
This family provides the specification to be used for using multiple layers of encryption keys to ultimately secure the protected data encrypted on the storage.

Component leveling:

<table>
<thead>
<tr>
<th>Component</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>FCS_KYC_EXT.1 Extended: Key Chaining</td>
<td></td>
</tr>
</tbody>
</table>

FCS_KYC_EXT.1 Key Chaining, requires the TSF to maintain a key chain and specifies the characteristics of that chain.

Management:
The following actions could be considered for the management functions in FMT:

- There are no management actions foreseen.

Audit:
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:

- There are no auditable events foreseen.

FCS_KYC_EXT.1 Key Chaining

Hierarchical to: No other components.

Dependencies:
- [FCS_COP.1(e) Cryptographic operation (Key Wrapping), FCS_SMC_EXT.1 Extended: Submask Combining, FCS_COP.1(i) Cryptographic operation (Key Transport), FCS_KDF_EXT.1 Cryptographic Operation (Key Derivation), and/or FCS_COP.1(f) Cryptographic operation (Key Encryption)].

FCS_KYC_EXT.1.1 The TSF shall maintain a key chain of: [selection: one, using a submask as the BEV or DEK; intermediate keys originating from one or more submask(s) to the BEV or DEK using the following method(s): [selection: key wrapping as specified in FCS_COP.1(e), key combining as specified in FCS_SMC_EXT.1, key encryption as specified in FCS_COP.1(f), key derivation as specified in FCS_KDF_EXT.1, key transport as specified in FCS_COP.1(i)] while maintaining an effective strength of [selection: 128-bit and 256-bit].

Rationale:
Key Chaining ensures that the TSF maintains the key chain, and also specifies the characteristics of that chain. However, the Common Criteria does not provide a suitable SFR for the management of multiple layers of encryption key to protect encrypted data. This extended component protects the TSF data using cryptographic algorithms, and it is therefore placed in the FCS class with a single component.
FCS_RBG_EXT   Extended: Cryptographic Operation (Random Bit Generation)

Family Behavior:
This family defines requirements for random bit generation to ensure that it is performed in accordance with selected standards and seeded by an entropy source.

Component leveling:

| FCS_RBG_EXT.1 Extended: Random Bit Generation | 1 |

FCS_RBG_EXT.1 Random Bit Generation requires random bit generation to be performed in accordance with selected standards and seeded by an entropy source.

Management:
The following actions could be considered for the management functions in FMT:

- There are no management actions foreseen.

Audit:
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:

- There are no auditable events foreseen.

FCS_RBG_EXT.1 Random Bit Generation

Hierarchical to: No other components.

Dependencies: No dependencies.

FCS_RBG_EXT.1.1 The TSF shall perform all deterministic random bit generation services in accordance with [selection: ISO/IEC 18031:2011, NIST SP 800-90A] using [selection: Hash_DRBG (any), HMAC_DRBG (any), CTR_DRBG (AES)].

FCS_RBG_EXT.1.2 The deterministic RBG shall be seeded by an entropy source that accumulates entropy from [selection: [assignment: number of software-based sources] software-based noise source(s), [assignment: number of hardware-based sources] hardware-based noise source(s)] with a minimum of [selection: 128 bits, 256 bits] of entropy at least equal to the greatest security strength, according to ISO/IEC 18031:2011 Table C.1 "Security strength table for hash functions", of the keys and hashes that it will generate.

Rationale:
Random bits/number will be used by the SFRs for key generation and destruction, and the Common Criteria does not provide a suitable SFR for the random bit generation. This extended component ensures the strength of encryption keys, and it is therefore placed in the FCS class with a single component.
FCS_TLS_EXT Extended: TLS selected

Family Behavior:
This family addresses the ability for a server and/or a client to use TLS to protect data between a client and the server using the TLS protocol.

Component leveling:

| FCS_TLS_EXT.1 Extended: TLS selected | 1 |

FCS_TLS_EXT.1 TLS selected, requires the TLS protocol implemented as specified.

Management:
The following actions could be considered for the management functions in FMT:

- There are no management actions foreseen.

Audit:
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:

- Failure of TLS session establishment

FCS_TLS_EXT.1 Extended: TLS selected

Hierarchical to: No other components.

Dependencies:
- FCS_CKM.1(a) Cryptographic Key Generation (for asymmetric keys)
- FCS_COP.1(a) Cryptographic Operation (Symmetric encryption/decryption)
- FCS_COP.1(b) Cryptographic Operation (for signature generation/verification)
- FCS_COP.1(c) Cryptographic Operation (Hash Algorithm)
- FCS_COP.1(g) Cryptographic Operation (for keyed-hash message authentication)
- FCS_RBG_EXT.1 Extended: Cryptographic Operation (Random Bit Generation)

FCS_TLS_EXT.1.1 The TSF shall implement one or more of the following protocols [selection: TLS 1.0 (RFC 2246), TLS 1.1 (RFC 4346), TLS 1.2 (RFC 5246)] supporting the following cipher suites:

Mandatory cipher suites:
TLS_RSA_WITH_AES_128_CBC_SHA

Optional cipher suites:
Rationale:
TLS is one of the secure communication protocols, and the Common Criteria does not provide a suitable SFR for the communication protocols using cryptographic algorithms. This extended component protects the communication data using cryptographic algorithms, and it is therefore placed in the FCS class with a single component.

5.1.3. Class FDP: User Data Protection

FDP_DSK_EXT Extended: Protection of Data on Disk

Family Behavior:
This family is to mandate the encryption of all protected data written to the storage.

Component leveling:

FDP_DSK_EXT.1 Extended: Protection of Data on Disk

FDP_DSK_EXT.1 Extended: Protection of Data on Disk, requires the TSF to encrypt all the Confidential TSF and User Data stored on the Field-Replaceable Nonvolatile Storage Devices in order to avoid storing these data in plaintext on the devices.
Management:
The following actions could be considered for the management functions in FMT:

- There are no management actions foreseen.

Audit:
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:

- There are no auditable events foreseen.

FDP_DSK_EXT.1 Protection of Data on Disk

Hierarchical to: No other components.
Dependencies: FCS_COP.1(d) Cryptographic operation (AES Data Encryption/Decryption)

FDP_DSK_EXT.1.1 The TSF shall [selection: perform encryption in accordance with FCS_COP.1(d), use a self-encrypting Field-Replaceable Nonvolatile Storage Device that is separately CC certified to conform to the FDE EE cPP] such that any Field-Replaceable Nonvolatile Storage Device contains no plaintext User Document Data and no plaintext confidential TSF Data.

FDP_DSK_EXT.1.2 The TSF shall encrypt all protected data without user intervention.

Rationale:
Extended: Protection of Data on Disk is to specify that encryption of any confidential data without user intervention, and the Common Criteria does not provide a suitable SFR for the Protection of Data on Disk. This extended component protects the Data on Disk, and it is therefore placed in the FDP class with a single component.

5.1.4. Class FIA: Identification and Authentication

FIA_PMG_EXT Extended: Password Management

Family Behavior:
This family defines requirements for the attributes of passwords used by administrative users to ensure that strong passwords and passphrases can be chosen and maintained.

Component leveling:

FIA PMG EXT.1 Extended: Password Management 1

FIA_PMG_EXT.1 Password management requires the TSF to support passwords with varying composition requirements, minimum lengths, maximum lifetime, and similarity constraints.
Management:
The following actions could be considered for the management functions in FMT:
• There are no management actions foreseen.

Audit:
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:
• There are no auditable events foreseen.

FIA_PMG_EXT.1 Password management
Hierarchical to: No other components.
Dependencies: No dependencies.

FIA_PMG_EXT.1.1 The TSF shall provide the following password management capabilities for User passwords:
Passwords shall be able to be composed of any combination of upper and lower case letters, numbers, and the following special characters: [selection: "!", "@", "#", "$", "%", "^", ",", ",", "("], [assignment: other characters]];
Minimum password length shall be settable by an Administrator, and have the capability to require passwords of 15 characters or greater.

Rationale:
Password Management is to ensure the strong authentication between the endpoints of communication, and the Common Criteria does not provide a suitable SFR for the Password Management.
This extended component protects the TOE by means of password management, and it is therefore placed in the FIA class with a single component.

5.1.5. Class FPT: Protection of the TSF

FPT_KYP_EXT Extended: Protection of Key and Key Material

Family Behavior:
This family addresses the requirements for keys and key materials to be protected if and when written to nonvolatile storage.

Component leveling:

FPT_KYP_EXT.1 Extended: Protection of key and key material

FPT_KYP_EXT.1 Extended: Protection of key and key material, requires the TSF to ensure that no plaintext key or key materials are written to nonvolatile storage.

Management:
The following actions could be considered for the management functions in FMT:
• There are no management actions foreseen.

Audit:
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:
• There are no auditable events foreseen.

FPT_KYP_EXT.1 Protection of Key and Key Material
Hierarchical to: No other components.
Dependencies: No dependencies.

FPT_KYP_EXT.1.1 The TSF shall not store plaintext keys that are part of the keychain specified by FCS_KYC_EXT.1 in any Field-Replaceable Nonvolatile Storage Device, and not store any such plaintext key on a device that uses the key for its encryption.

Rationale:
Protection of Key and Key Material is to ensure that no plaintext key or key material are written to nonvolatile storage, and the Common Criteria does not provide a suitable SFR for the protection of key and key material.
This extended component protects the TSF data, and it is therefore placed in the FPT class with a single component.

FPT_SKP_EXT Extended: Protection of TSF Data

Family Behavior:
This family addresses the requirements for managing and protecting the TSF data, such as cryptographic keys. This is a new family modelled as the FPT Class.

Component leveling:

FPT_SKP_EXT.1 Extended: Protection of TSF Data

FPT_SKP_EXT.1 Protection of TSF Data (for reading all symmetric keys), requires preventing symmetric keys from being read by any user or subject. It is the only component of this family.

Management:
The following actions could be considered for the management functions in FMT:
• There are no management actions foreseen.

Audit:
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:
• There are no auditable events foreseen.
FPT_SKP_EXT.1 Protection of TSF Data
Hierarchical to: No other components.
Dependencies: No dependencies.

FPT_SKP_EXT.1.1 The TSF shall prevent reading of all pre-shared keys, symmetric keys, and private keys.

Rationale:
Protection of TSF Data is to ensure the pre-shared keys, symmetric keys and private keys are protected securely, and the Common Criteria does not provide a suitable SFR for the protection of such TSF data. This extended component protects the TOE by means of strong authentication using Pre-shared Key, and it is therefore placed in the FPT class with a single component.

FPT_TST_EXT Extended: TSF testing

Family Behavior:
This family addresses the requirements for self-testing the TSF for selected correct operation.

Component leveling:

FPT_TST_EXT.1 Extended: TSF testing

FPT_TST_EXT.1 TSF testing requires a suite of self-testing to be run during initial start-up in order to demonstrate correct operation of the TSF.

Management:
The following actions could be considered for the management functions in FMT:

• There are no management actions foreseen.

Audit:
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:

• There are no auditable events foreseen.

FPT_TST_EXT.1 TSF testing
Hierarchical to: No other components.
Dependencies: No dependencies.

FPT_TST_EXT.1.1 The TSF shall run a suite of self-tests during initial start-up (and power on) to demonstrate the correct operation of the TSF.

Rationale:
TSF testing is to ensure the TSF can be operated correctly, and the Common Criteria does not provide a suitable SFR for the TSF testing. There is no SFR defined for TSF testing.
This extended component protects the TOE, and it is therefore placed in the FPT class with a single component.

**FPT_TUD_EXT Extended: Trusted Update**

**Family Behavior:**
This family defines requirements for the TSF to ensure that only administrators can update the TOE firmware/software, and that such firmware/software is authentic.

**Component leveling:**

| FPT_TUD_EXT.1 Extended: Trusted Update | 1 |

**FPT_TUD_EXT.1 Trusted Update** ensures authenticity and access control for updates.

**Management:**
The following actions could be considered for the management functions in FMT:
- There are no management actions foreseen.

**Audit:**
The following actions should be auditable if FAU_GEN Security Audit Data Generation is included in the PP/ST:
- There are no auditable events foreseen.

**FPT_TUD_EXT.1 Trusted Update**

- **Hierarchical to:** No other components.
- **Dependencies:** [FCS_COP.1(b) Cryptographic Operation (for signature generation/verification), or FCS_COP.1(c) Cryptographic operation (Hash Algorithm)].

**FPT_TUD_EXT.1.1** The TSF shall provide authorized administrators the ability to query the current version of the TOE firmware/software.

**FPT_TUD_EXT.1.2** The TSF shall provide authorized administrators the ability to initiate updates to TOE firmware/software.

**FPT_TUD_EXT.1.3** The TSF shall provide a means to verify firmware/software updates to the TOE using a digital signature mechanism and [selection: published hash, no other functions] prior to installing those updates.

**Rationale:**
Firmware/software is a form of TSF Data, and the Common Criteria does not provide a suitable SFR for the management of firmware/software. In particular, there is no SFR defined for importing TSF Data.
This extended component protects the TOE, and it is therefore placed in the FPT class with a single component.
6. SECURITY REQUIREMENTS

This chapter describes the security functional requirements, security assurance requirements, and security requirement rational.

The definitions of terms used in this chapter are as follows.

6.1. Notation

**Bold** typeface indicates the portion of an SFR that has been completed or refined in HCD-PP, relative to the original SFR definition in Common Criteria Part 2 or to its Extended Component Definition.

**Bold italic** typeface indicates the portion of an SFR that has been partially completed or refined in HCD-PP. It also must be selected and/or completed in this ST.

**Underlined bold italic** typeface in parentheses that follows underlined bold typeface indicates the portion of an SFR that has been partially completed in HCD-PP and refined in this ST.

**Italic** typeface indicates the text within an SFR that must be selected and/or completed in this ST.

**Gray italic** typeface indicates the text within an SFR that has not been selected in this ST.

**Underlined italic** typeface indicates the text within an SFR that has been assigned in this ST.

The definition of SFR components followed by (a), (b)… is as described in the PP. SFR components followed by (a1), (a2)… represent required iterations of iterations.

6.2. Security Functional Requirements

Security functional requirements provided by the TOE are described below.

6.2.1. Class FAU: Security Audit

<table>
<thead>
<tr>
<th>FAU_GEN.1</th>
<th>Audit data generation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(for O_AUDIT)</td>
</tr>
</tbody>
</table>

Hierarchical to: No other components.

Dependencies: FPT_STM.1 Reliable time stamps

**FAU_GEN.1.1**

The TSF shall be able to generate an audit record of the following auditable events:

a) Start-up and shutdown of the audit functions;

b) All auditable events for the **not specified** level of audit; and

c) **All auditable events specified in Table 10**, [assignment: **no other auditable events**].

**FAU_GEN.1.2**

The TSF shall record within each audit record at least the following information:
a) Date and time of the event, type of event, subject identity (if applicable), and the outcome (success or failure) of the event; and

b) For each audit event type, based on the auditable event definitions of the functional components included in the PP/ST, additional information specified in Table 10, [assignment: no other relevant information].

**Table 10 Auditable Events**

<table>
<thead>
<tr>
<th>Auditable Events</th>
<th>Relevant SFR</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job completion</td>
<td>FDP_ACF.1</td>
<td>Type of job</td>
</tr>
<tr>
<td>Unsuccessful User authentication</td>
<td>FIA_UAU.1</td>
<td>None</td>
</tr>
<tr>
<td>Unsuccessful User identification</td>
<td>FIA_UID.1</td>
<td>None</td>
</tr>
<tr>
<td>Use of management functions</td>
<td>FMT_SMF.1</td>
<td>None</td>
</tr>
<tr>
<td>Modification to the group of Users that are part of a role</td>
<td>FMT_SMR.1</td>
<td>None</td>
</tr>
<tr>
<td>Changes to the time</td>
<td>FPT_STM.1</td>
<td>None</td>
</tr>
<tr>
<td>Failure to establish session</td>
<td>FTP_ITC.1, FTP_TRP.1(a), FTP_TRP.1(b)</td>
<td>Reason for failure</td>
</tr>
</tbody>
</table>

**FAU_GEN.2**

**User identity association**

(for O.AUDIT)

Hierarchical to: No other components.

Dependencies:
- FAU_GEN.1 Audit data generation
- FIA_UID.1 Timing of identification

**FAU_GEN.2.1**

For audit events resulting from actions of identified users, the TSF shall be able to associate each auditable event with the identity of the user that caused the event.

**FAU_SAR.1**

**Audit review**

(for O.AUDIT)

Hierarchical to: No other components.

Dependencies:
- FAU_GEN.1 Audit data generation

**FAU_SAR.1.1**

The TSF shall provide [assignment: U.ADMIN] with the capability to read **all records** from the audit records.
FAU_SAR.1.2 The TSF shall provide the audit records in a manner suitable for the user to interpret the information.

FAU_SAR.2 Restricted audit review (for O.AUDIT)
Hierarchical to: No other components.
Dependencies: FAU_SAR.1 Audit review

FAU_SAR.2.1 The TSF shall prohibit all users read access to the audit records, except those users that have been granted explicit read-access.

FAU_STG.1 Protected audit trail storage (for O.AUDIT)
Hierarchical to: No other components.
Dependencies: FAU_GEN.1 Audit data generation

FAU_STG.1.1 The TSF shall protect the stored audit records in the audit trail from unauthorised deletion.

FAU_STG.1.2 The TSF shall be able to prevent unauthorised modifications to the stored audit records in the audit trail.

FAU_STG.4 Prevention of audit data loss (for O.AUDIT)
Hierarchical to: FAU_STG.3 Action in case of possible audit data loss
Dependencies: FAU_STG.1 Protected audit trail storage

FAU_STG.4.1 Refinement: The TSF shall [selection, choose one of: “ignore audited events”, “prevent audited events, except those taken by the authorised user with special rights”, “overwrite the oldest stored audit records”] and [assignment: no other actions to be taken] if the audit trail is full.

FAU_STG_EXT.1 Extended: External Audit Trail Storage (for O.AUDIT)
Hierarchical to: No other components.
Dependencies: FAU_GEN.1 Audit data generation, FTP_ITC.1 Inter-TSF trusted channel.
FAU_STG_EXT.1.1  The TSF shall be able to transmit the generated audit data to an External IT Entity using a trusted channel according to FTP_ITC.1.

6.2.2. Class FCS: Cryptographic Support

**FCS_CKM.1(a)**  Cryptographic Key Generation (for asymmetric keys)  
(for O.COMMS_PROTECTION)

Hierarchical to:  No other components.

Dependencies:  [FCS_COP.1(b) Cryptographic Operation (for signature generation/verification), or  
FCS_COP.1(i) Cryptographic operation (Key Transport)]  
FCS_CKM_EXT.4 Extended: Cryptographic Key Material Destruction

**FCS_CKM.1.1(a)**  Refinement: The TSF shall generate asymmetric cryptographic keys used for key establishment in accordance with [selection:  
• NIST Special Publication 800-56A, “Recommendation for Pair-Wise Key Establishment Schemes Using Discrete Logarithm Cryptography” for finite field-based key establishment schemes;  
• NIST Special Publication 800-56A, “Recommendation for Pair-Wise Key Establishment Schemes Using Discrete Logarithm Cryptography” for elliptic curve-based key establishment schemes and implementing “NIST curves” P-256, P-384 and [selection: P-521, no other curves] (as defined in FIPS PUB 186-4, “Digital Signature Standard”)  
• NIST Special Publication 800-56B, “Recommendation for Pair-Wise Key Establishment Schemes Using Integer Factorization Cryptography” for RSA-based key establishment schemes ] and specified cryptographic key sizes equivalent to, or greater than, a symmetric key strength of 112 bits.

**FCS_CKM.1(b)**  Cryptographic key generation (Symmetric Keys)  
(for O.COMMS_PROTECTION, O.STORAGE_ENCRYPTION)

Hierarchical to:  No other components.

Dependencies:  [FCS_COP.1(a) Cryptographic Operation (Symmetric encryption/decryption), or
FCS_COP.1(d) Cryptographic Operation (AES Data Encryption/Decryption), or
FCS_COP.1(e) Cryptographic Operation (Key Wrapping), or
FCS_COP.1(f) Cryptographic operation (Key Encryption), or
FCS_COP.1(g) Cryptographic Operation (for keyed-hash message authentication), or
FCS_COP.1(h) Cryptographic Operation (for keyed-hash message authentication)]
FCS_CKM_EXT.4 Extended: Cryptographic Key Material Destruction
FCS_RBG_EXT.1 Extended: Cryptographic Operation (Random Bit Generation)

FCS_CKM.1.1(b) Refinement: The TSF shall generate symmetric cryptographic keys using a Random Bit Generator as specified in FCS_RBG_EXT.1 and specified cryptographic key sizes [selection: 128-bit, 256-bit] that meet the following: No Standard.

FCS_CKM.4 Cryptographic key destruction
(for O.COMMS_PROTECTION, O.STORAGE_ENCRYPTION, O.PURGE_DATA)

Hierarchical to: No other components.
Dependencies: [FCS_CKM.1(a) Cryptographic Key Generation (for asymmetric keys), or
FCS_CKM.1(b) Cryptographic key generation (Symmetric Keys)]

FCS_CKM.4.1 Refinement: The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method [selection:

For volatile memory, the destruction shall be executed by [selection: powering off a device, [assignment: other mechanism that ensures keys are destroyed]]:

For nonvolatile storage, the destruction shall be executed by a [selection: single, three or more times] overwrite of key data storage location consisting of [selection: a pseudo random pattern using the TSF’s RBG (as specified in FCS_RBG_EXT.1), a static pattern], followed by a [selection: read-verify, none]. If read-verification of the overwritten data fails, the process shall be repeated again;
that meets the following: [selection: NIST SP800-88, no standard].

**FCS_CKM_EXT.4**

**Cryptographic Key Material Destruction**
(for O.COMMS_PROTECTION, O.STORAGE_ENCRYPTION, O.PURGE_DATA)

**Hierarchical to:** No other components.

**Dependencies:**
[FCS_CKM.1(a) Cryptographic Key Generation (for asymmetric keys), or
FCS_CKM.1(b) Cryptographic key generation (Symmetric Keys),
FCS_CKM.4 Cryptographic key destruction]

**FCS_CKM_EXT.4.1**
The TSF shall destroy all plaintext secret and private cryptographic keys and cryptographic critical security parameters when no longer needed.

**FCS_COP.1(a)**

**Cryptographic Operation (Symmetric encryption/decryption)**
(for O.COMMS_PROTECTION)

**Hierarchical to:** No other components.

**Dependencies:**
FCS_CKM.1(b) Cryptographic key generation (Symmetric Keys)
FCS_CKM_EXT.4 Extended: Cryptographic Key Material Destruction

**FCS_COP.1.1(a)**

Refinement: The TSF shall perform encryption and decryption in accordance with a specified cryptographic algorithm AES operating in [assignment: CBC, GCM] and cryptographic key sizes 128-bits and 256-bits that meets the following:
FIPS PUB 197, “Advanced Encryption Standard (AES)”
[Selection: NIST SP 800-38A, NIST SP 800-38B, NIST SP 800-38C, NIST SP 800-38D]

**FCS_COP.1(b1)**

**Cryptographic Operation (for signature generation/verification)**
(for O.UPDATE VERIFICATION)

**Hierarchical to:** No other components.

**Dependencies:**
FCS_CKM.1(a) Cryptographic Key Generation (for asymmetric keys)
FCS_COP.1.1(b1) Refinement: The TSF shall perform cryptographic signature services in accordance with a [selection: 
-Digital Signature Algorithm (DSA) with key sizes (modulus) of [assignment: 2048 bits or greater], 
*RSA Digital Signature Algorithm (rDSA) with key sizes (modulus) of [assignment: 2048 bits or greater],* or 
-Elliptic Curve Digital Signature Algorithm (ECDSA) with key sizes of [assignment: 256 bits or greater]]
that meets the following [selection: 
Case: Digital Signature Algorithm FIPS PUB 186-4, “Digital Signature Standard”
Case: RSA Digital Signature Algorithm FIPS PUB 186-4, “Digital Signature Standard”
Case: Elliptic Curve Digital Signature Algorithm FIPS PUB 186-4, “Digital Signature Standard”
The TSF shall implement “NIST curves” P-256, P384 and [selection: P521, no other curves] (as defined in FIPS PUB 186-4, “Digital Signature Standard”).]
.

FCS_COP.1(b2) Cryptographic Operation (for signature generation/verification)
(for O.COMMS_PROTECTION)
Hierarchical to: No other components.
Dependencies: FCS_CKM.1(a) Cryptographic Key Generation (for asymmetric keys)
FCS_CKM_EXT.4 Extended: Cryptographic Key Material Destruction

FCS_COP.1.1(b2) Refinement: The TSF shall perform cryptographic signature services in accordance with a [selection: 
-Digital Signature Algorithm (DSA) with key sizes (modulus) of [assignment: 2048 bits or greater], 
*RSA Digital Signature Algorithm (rDSA) with key sizes (modulus) of [assignment: 2048 bits, 3072 bits],* or 
-Elliptic Curve Digital Signature Algorithm (ECDSA) with key sizes of [assignment: 256 bits, 384bits, 521bits]]
that meets the following [selection: 

Case: Digital Signature Algorithm FIPS PUB 186-4, “Digital Signature Standard”

Case: RSA Digital Signature Algorithm FIPS PUB 186-4, “Digital Signature Standard”

Case: Elliptic Curve Digital Signature Algorithm FIPS PUB 186-4, “Digital Signature Standard”

The TSF shall implement “NIST curves” P-256, P384 and [selection: P521, no other curves] (as defined in FIPS PUB 186-4, “Digital Signature Standard”).

].

FCS_COP.1(c1) Cryptographic operation (Hash Algorithm)
(selected in FPT_TUD_EXT.1.3, or with FCS_SNI_EXT.1.1)

Hierarchical to: No other components.
Dependencies: No dependencies.

FCS_COP.1.1(c1) Refinement: The TSF shall perform cryptographic hashing services in accordance with [selection: SHA-1, SHA-256, SHA-384, SHA-512] that meet the following: [ISO/IEC 10118-3:2004].

FCS_COP.1(c2) Cryptographic operation (Hash Algorithm)
(for O.COMMS_PROTECTION)

Hierarchical to: No other components.
Dependencies: No dependencies.

FCS_COP.1.1(c2) Refinement: The TSF shall perform cryptographic hashing services in accordance with [selection: SHA-1, SHA-256, SHA-384, SHA-512] that meet the following: [ISO/IEC 10118-3:2004].

FCS_COP.1(d) Cryptographic operation (AES Data Encryption/Decryption)
(for O. STORAGE_ENCRYPTION)

Hierarchical to: No other components.
Dependencies: FCS_CKM.1(b) Cryptographic key generation (Symmetric Keys)]
FCS_CKM_EXT.4 Extended: Cryptographic Key Material Destruction

FCS_COP.1.1(d) The TSF shall perform data encryption and decryption in accordance with a specified cryptographic algorithm AES used
in [selection: CBC, GCM, XTS] mode and cryptographic key sizes [selection: 128 bits, 256 bits] that meet the following:

**FCS_COP.1(f)**
Cryptographic operation (Key Encryption)
(selected from FCS_KYC_EXT.1.1)

Hierarchical to: No other components.
Dependencies: FCS_CKM.1(b) Cryptographic key generation (Symmetric Keys)
FCS_CKM_EXT.4 Extended: Cryptographic Key Material Destruction

**FCS_COP.1.1(f)**
Reinforcement: The TSF shall perform key encryption and decryption in accordance with a specified cryptographic algorithm AES used in [selection: CBC, GCM] mode and cryptographic key sizes [selection: 128 bits, 256 bits] that meet the following: [AES as specified in ISO/IEC 18033-3, CBC as specified in ISO/IEC 10116, GCM as specified in ISO/IEC 19772].

**FCS_COP.1(g)**
Cryptographic Operation (for keyed-hash message authentication)
(selected with FCS_IPSEC_EXT.1.4)

Hierarchical to: No other components.
Dependencies: FCS_CKM.1(b) Cryptographic key generation (Symmetric Keys)
FCS_CKM_EXT.4 Extended: Cryptographic Key Material Destruction

**FCS_COP.1.1(g)**

**FCS_HTTPS_EXT.1**
HTTPS selected
(selected in FTP_ITC.1.1, FTP_TRP.1.1)
Hierarchical to: No other components.

Dependencies: FCS_TLS_EXT.1 Extended: TLS selected

FCS_HTTPS_EXT.1.1 The TSF shall implement the HTTPS protocol that complies with RFC 2818.

FCS_HTTPS_EXT.1.2 The TSF shall implement HTTPS using TLS as specified in FCS_TLS_EXT.1.

FCS_KYC_EXT.1 Key Chaining
(for O.STORAGE_ENCRYPTION)

Hierarchical to: No other components.

Dependencies: [FCS_COP.1(e) Cryptographic operation (Key Wrapping), or FCS_SMC_EXT.1 Extended: Submask Combining, or FCS_COP.1(f) Cryptographic operation (Key Encryption), or FCS_KDF_EXT.1 Cryptographic Operation (Key Derivation), and/or FCS_COP.1(i) Cryptographic operation (Key Transport)]

FCS_KYC_EXT.1.1 The TSF shall maintain a key chain of: [selection: one, using a submask as the BEV or DEK; intermediate keys originating from one or more submask(s) to the BEV or DEK using the following method(s): [selection: key wrapping as specified in FCS_COP.1(e), key combining as specified in FCS_SMC_EXT.1, key encryption as specified in FCS_COP.1(f), key derivation as specified in FCS_KDF_EXT.1, key transport as specified in FCS_COP.1(i)]] while maintaining an effective strength of [selection: 128 bits, 256 bits].

FCS_RBG_EXT.1 Cryptographic Operation (Random Bit Generation)
(for O.STORAGE_ENCRYPTION and O.COMMS_PROTECTION)

Hierarchical to: No other components.

Dependencies: No dependencies.

FCS_RBG_EXT.1.1 The TSF shall perform all deterministic random bit generation services in accordance with [selection: ISO/IEC 18031:2011, NIST SP 800-90A] using [selection: Hash_DRBG (any), HMAC_DRBG (any), CTR_DRBG (AES)].
FCS_RBG_EXT.1.2 The deterministic RBG shall be seeded by at least one entropy source that accumulates entropy from [selection: [assignment:1] software-based noise source(s), [assignment: number of hardware-based sources] hardware-based noise source(s)] with a minimum of [selection: 128 bits, 256 bits] of entropy at least equal to the greatest security strength, according to ISO/IEC18031:2011 Table C.1 “Security Strength Table for Hash Functions”, of the keys and hashes that it will generate.

FCS_TLS_EXT.1 TLS selected
(selected in FTP_ITC.1.1, FTP_TRP.1.1)

Hierarchical to: No other components.

Dependencies: FCS_CKM.1(a) Cryptographic Key Generation (for asymmetric keys)
FCS_COP.1(a) Cryptographic Operation (Symmetric encryption/decryption)
FCS_COP.1(b) Cryptographic Operation (for signature generation/verification)
FCS_COP.1(c) Cryptographic Operation (Hash Algorithm)
FCS_COP.1(g) Cryptographic Operation (for keyed-hash message authentication)
FCS_RBG_EXT.1 Extended: Cryptographic Operation (Random Bit Generation)

FCS_TLS_EXT.1.1 The TSF shall implement one or more of the following protocols [selection: TLS 1.0 (RFC 2246), TLS 1.1 (RFC 4346), TLS 1.2 (RFC 5246)] supporting the following cipher suites:

Mandatory Ciphersuites:
TLS_RSA_WITH_AES_128_CBC_SHA

Optional Ciphersuites:
[selection:
None
TLS_RSA_WITH_AES_256_CBC_SHA
TLS_DHE_RSA_WITH_AES_128_CBC_SHA
TLS_DHE_RSA_WITH_AES_256_CBC_SHA
TLS_RSA_WITH_AES_128_CBC_SHA256
TLS_RSA_WITH_AES_256_CBC_SHA256
TLS_DHE_RSA_WITH_AES_128_CBC_SHA256
TLS_DHE_RSA_WITH_AES_256_CBC_SHA256]
6.2.3. Class FDP: User Data Protection

FDP_ACC.1  Subset access control
(for O.ACCESS_CONTROL and O.USER_AUTHORIZATION)

Hierarchical to: No other components.
Dependencies: FDP_ACF.1  Security attribute-based access control

FDP_ACC.1.1 Refinement: The TSF shall enforce the User Data Access Control SFP on subjects, objects, and operations among subjects and objects specified in Table 11 and Table 12.

FDP_ACF.1  Security attribute-based access control
(for O.ACCESS_CONTROL and O.USER_AUTHORIZATION)

Hierarchical to: No other components.
Dependencies: FDP_ACC.1  Subset access control
FMT_MSA.3  Static attribute initialization

FDP_ACF.1.1 Refinement: The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: rules governing access among controlled subjects and controlled objects using controlled operations on controlled objects specified in Table 11 and Table 12.

FDP_ACF.1.2 Refinement: The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: rules governing access among controlled subjects and controlled objects using controlled operations on controlled objects specified in Table 11 and Table 12.
Refinement: The TSF shall explicitly authorize access of subjects to objects based on the following additional rules: [assignment: none].

Refinement: The TSF shall explicitly deny access of subjects to objects based on the following additional rules: [assignment: none].

</table>

Note 1: Job Owner is identified by a credential or assigned to an authorized User as part of the process of submitting a print or storage Job.

Note 2: Job Owner is assigned to an authorized User as part of the process of initiating a scan, copy, or retrieval Job.

Note 3: With Mailbox I/F, Key Operator can operate the DOC of all users, while SA can operate the DOC of his/her own only. But, stored copy files cannot be retrieved even by owner or Key Operator. With On Demand Overwrite I/F, Key Operator and SA can delete all the DOC of all users.

Note 4: Job owner can modify the stored copy DOC of his/her own only. On the other hand, scan DOC cannot be modified by anyone even if its owner.

Note 5: Key Operator can modify the stored copy DOC of all users, while SA can modify the stored copy DOC of his/her own only. On the other hand, scan DOC cannot be modified by anyone even if Key Operator or SA.

**FDP_DSK_EXT.1**

Protection of Data on Disk
(for O.STORAGE_ENCRYPTION)

- Hierarchical to: No other components.
- Dependencies: FCS_COP.1(d) Cryptographic operation (AES Data Encryption/Decryption).

**FDP_DSK_EXT.1.1**

The TSF shall [selection: perform encryption in accordance with FCS_COP.1(d), use a self-encrypting Field-Replaceable Nonvolatile Storage Device that is separately CC certified to conform to the FDE EE cPP], such that any Field-Replaceable
Nonvolatile Storage Device contains no plaintext User Document Data and no plaintext Confidential TSF Data.

FDP_DSK_EXT.1.2 The TSF shall encrypt all protected data without user intervention.

FDP_RIP.1(a) Subset residual information protection (for O.IMAGE_OVERWRITE)

Hierarchical to: No other components.
Dependencies: No dependencies.

FDP_RIP.1.1(a) Refinement: The TSF shall ensure that any previous information content of a resource is made unavailable by overwriting data upon the deallocation of the resource from the following objects: D.USER.DOC.

6.2.4. Class FIA: Identification and Authentication

FIA_AFL.1 Authentication failure handling (for O.USER_I&A)

Hierarchical to: No other components.
Dependencies: FIA_UAU.1 Timing of authentication

FIA_AFL.1.1 The TSF shall detect when [selection: [assignment: 5], an administrator configurable positive integer within [assignment: range of acceptable values]] unsuccessful authentication attempts occur related to [assignment: User authentication (with local authentication)].

FIA_AFL.1.2 When the defined number of unsuccessful authentication attempts has been [selection: met, surpassed], the TSF shall [assignment: Identification and authentication of relevant user is inhibited until TOE is cycled].

FIA_ATD.1 User attribute definition (for O.USER_AUTHORIZATION)

Hierarchical to: No other components.
Dependencies: No dependencies.
FIA_ATD.1.1 The TSF shall maintain the following list of security attributes belonging to individual users: [assignment: User Identifier, User Role].

FIA_PMG_EXT.1 Password Management
(for O.USER_I&A)

Hierarchical to: No other components.
Dependencies: No dependencies.

FIA_PMG_EXT.1.1 The TSF shall provide the following password management capabilities for user passwords:

- Passwords shall be able to be composed of any combination of upper and lower case letters, numbers, and the following special characters: [selection: !", @", #", $", %", ^", ",&", "", "("", ")", [assignment: " (space)", ",", ",", +", ",", -, -", ",", ",", ",", ",", ",", ",", ",", ",", ",", -"],
- Minimum password length shall be settable by an Administrator, and have the capability to require passwords of 15 characters or greater;

FIA_UAU.1 Timing of authentication
(for O.USER_I&A)

Hierarchical to: No other components.
Dependencies: FIA_UID.1 Timing of identification

FIA_UAU.1.1 Refinement: The TSF shall allow [assignment: none] on behalf of the user to be performed before the user is authenticated.

FIA_UAU.1.2 The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

FIA_UAU.7 Protected authentication feedback
(for O.USER_I&A)

Hierarchical to: No other components.
Dependencies: FIA_UAU.1 Timing of authentication

FIA_UAU.7.1 The TSF shall provide only [assignment: Web UI: ●, Local UI: asterisks] to the user while the authentication is in progress.
FIA_UID.1  Timing of identification  
(for O.USER_I&A and O.ADMIN_ROLES)

Hierarchical to:  No other components.  
Dependencies:  No dependencies.  

FIA_UID.1.1  Refinement: The TSF shall allow [assignment: none] on behalf of the user to be performed before the user is identified.  

FIA_UID.1.2  The TSF shall require each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that user.

FIA_USB.1  User-subject binding  
(for O.USER_I&A)

Hierarchical to:  No other components.  
Dependencies:  FIA_ATD.1  User attribute definition

FIA_USB.1.1  The TSF shall associate the following user security attributes with subjects acting on the behalf of that user: [assignment: User Identifier, User Role].  

FIA_USB.1.2  The TSF shall enforce the following rules on the initial association of user security attributes with subjects acting on the behalf of users: [assignment: none].  

FIA_USB.1.3  The TSF shall enforce the following rules governing changes to the user security attributes associated with subjects acting on the behalf of users: [assignment: none].

6.2.5. Class FMT: Security Management

FMT_MOF.1  Management of security functions behavior  
(for O.ADMIN_ROLES)

Hierarchical to:  No other components.  
Dependencies:  FMT_SMR.1  Security roles  
FMT_SMF.1  Specification of Management Functions

FMT_MOF.1.1  Refinement:  The TSF shall restrict the ability to [selection: determine the behavior of, disable, enable, modify the
behavior of] the functions [assignment: List of security functions in Table 13] to U.ADMIN.

Table 13 List of Security Functions

FMT_MSA.1 Management of security attributes
(for O.ACCESS_CONTROL and O.USER_AUTHORIZATION)

Hierarchical to: No other components.

Dependencies:
- FDP_ACC.1 Subset access control
- FMT_SMR.1 Security roles
- FMT_SMF.1 Specification of Management Functions

FMT_MSA.1.1 Refinement: The TSF shall enforce the User Data Access Control SFP to restrict the ability to [selection: change_default, query, modify, delete, [assignment: creation]] the security attributes [assignment: the security attributes listed in Table 14] to [assignment: the roles listed in Table 14].

Table 14 Security Attributes and Authorized Roles

FMT_MSA.3 Static attribute initialization
(for O.ACCESS_CONTROL and O.USER_AUTHORIZATION)

Hierarchical to: No other components.

Dependencies: FMT_MSA.1 Management of security attributes
FMT_SMR.1 Security roles

**FMT_MSA.3.1** Refinement: The TSF shall enforce the **User Data Access Control SFP** to provide [selection, choose one of: restrictive, permissive, [assignment: none]] default values for security attributes that are used to enforce the SFP.

**FMT_MSA.3.2** Refinement: The TSF shall allow the [selection: U.ADMIN, no role] to specify alternative initial values to override the default values when an object or information is created.

**FMT_MTD.1** Management of TSF data
(for O.ACCESS CONTROL)

Hierarchical to: No other components.
Dependences: FMT_SMR.1 Security roles
FMT_SMF.1 Specification of Management Functions

**FMT_MTD.1.1** Refinement: The TSF shall restrict the ability to perform the specified operations on the specified TSF Data to the roles specified in Table 15.

<table>

</table>
FMT_SMR.1  
Security roles  
(for O.ACCESS_CONTROL, O.USER_AUTHORIZATION, and O.ADMIN_ROLES)

Hierarchical to: No other components.
Dependencies: FIA_UID.1 Timing of identification

FMT_SMR.1.1  
Refinement: The TSF shall maintain the roles U.ADMIN (U.ADMIN, SA, Key Operator), U.NORMAL

FMT_SMR.1.2  
The TSF shall be able to associate users with roles.

6.2.6. Class FPT: Protection of the TSF

FPT_KYP_EXT.1  
Protection of Key and Key Material  
(for O.KEY_MATERIAL)

Hierarchical to: No other components.
Dependencies: No dependencies.

FPT_KYP_EXT.1.1  
Refinement: The TSF shall not store plaintext keys that are part of the keychain specified by FCS_KYC_EXT.1 in any Field-Replaceable Nonvolatile Storage Device.

FPT_SKP_EXT.1  
Protection of TSF Data  
(for O.COMMS PROTECTION)

Hierarchical to: No other components.
Dependencies: No dependencies.

FPT_SKP_EXT.1.1  
The TSF shall prevent reading of all pre-shared keys, symmetric keys, and private keys.

FPT_STM.1  
Reliable time stamps  
(for O.AUDIT)

Hierarchical to: No other components.
Dependencies: No dependencies.

FPT_STM.1.1  
The TSF shall be able to provide reliable time stamps.
FPT_TST_EXT.1  
**TSF testing**  
(for O.TSF_SELF_TEST)

Hierarchical to: No other components.  
Dependencies: No dependencies.

FPT_TST_EXT.1.1  
The TSF shall run a suite of self-tests during initial start-up (and power on) to demonstrate the correct operation of the TSF.

FPT_TUD_EXT.1  
**Trusted Update**  
(for O.UPDATE_VERIFICATION)

Hierarchical to: No other components.  
Dependencies: FCS_COP.1(b) Cryptographic Operation (for signature generation/verification),  
FCS_COP.1(c) Cryptographic operation (Hash Algorithm).

FPT_TUD_EXT.1.1  
The TSF shall provide authorized administrators the ability to query the current version of the TOE firmware/software.

FPT_TUD_EXT.1.2  
The TSF shall provide authorized administrators the ability to initiate updates to TOE firmware/software.

FPT_TUD_EXT.1.3  
The TSF shall provide a means to verify firmware/software updates to the TOE using a digital signature mechanism and [selection: published hash, no other functions] prior to installing those updates.

6.2.7. Class FTA: TOE Access

FTA_SSL.3  
**TSF-initiated termination**  
(for O.USER_I&A)

Hierarchical to: No other components.  
Dependencies: No dependencies.

FTA_SSL.3.1  
The TSF shall terminate an interactive session after a [assignment:  
*Auto Clear time for the control panel: 10 to 900 seconds*  
*Login timeout for the Web UI: 20 minutes*  
*There is no inactive time with printer driver*  
].
6.2.8. Class FTP: Trusted Paths/Channels

**FTP_ITC.1**

Inter-TSF trusted channel
(for O.COMMS_PROTECTION, O.AUDIT)

Hierarchical to: No other components.

Dependencies: [FCS_IPSEC_EXT.1 Extended: IPsec selected, or FCS_TLS_EXT.1 Extended: TLS selected, or FCS_SSH_EXT.1 Extended: SSH selected, or FCS_HTTPS_EXT.1 Extended: HTTPS selected].

**FTP_ITC.1.1**

Refinement: The TSF shall use [selection: IPsec, SSH, TLS, TLS/HTTPS] to provide a trusted communication channel between itself and authorized IT entities supporting the following capabilities: [selection: authentication server, [assignment: Audit Log Server, Mail Server]] that is logically distinct from other communication channels and provides assured identification of its end points and protection of the channel data from disclosure and detection of modification of the channel data.

**FTP_ITC.1.2**

Refinement: The TSF shall permit the TSF, or the authorized IT entities, to initiate communication via the trusted channel.

**FTP_ITC.1.3**

Refinement: The TSF shall initiate communication via the trusted channel for [assignment: mail service, and audit transmission service].

**FTP_TRP.1(a)**

Trusted path (for Administrators)
(for O.COMMS_PROTECTION)

Hierarchical to: No other components.

Dependencies: [FCS_IPSEC_EXT.1 Extended: IPsec selected, or FCS_TLS_EXT.1 Extended: TLS selected, or FCS_SSH_EXT.1 Extended: SSH selected, or FCS_HTTPS_EXT.1 Extended: HTTPS selected].

**FTP_TRP.1.1(a)**

Refinement: The TSF shall use [selection, choose at least one of: IPsec, SSH, TLS, TLS/HTTPS] to provide a trusted communication path between itself and remote administrators that is logically distinct from other communication paths and provides assured identification of its end points and protection of the communicated data from disclosure and detection of modification of the communicated data.
FTP_TRP.1.2(a) Refinement: The TSF shall permit remote administrators to initiate communication via the trusted path.

FTP_TRP.1.3(a) Refinement: The TSF shall require the use of the trusted path for initial administrator authentication and all remote administration actions.

FTP_TRP.1(b) Trusted path (for Non-administrators) (for O.COMMS_PROTECTION)
Hierarchical to: No other components.
Dependencies: [FCS_IPSEC_EXT.1 Extended: IPsec selected, or FCS_TLS_EXT.1 Extended: TLS selected, or FCS_SSH_EXT.1 Extended: SSH selected, or FCS_HTTPS_EXT.1 Extended: HTTPS selected].

FTP_TRP.1.1(b) Refinement: The TSF shall use [selection, choose at least one of: IPsec, SSH, TLS, TLS/HTTPS] to provide a trusted communication path between itself and remote users that is logically distinct from other communication paths and provides assured identification of its end points and protection of the communicated data from disclosure and detection of modification of the communicated data.

FTP_TRP.1.2(b) Refinement: The TSF shall permit [selection: the TSF, remote users] to initiate communication via the trusted path.

FTP_TRP.1.3(b) Refinement: The TSF shall require the use of the trusted path for initial user authentication and all remote user actions.
6.3. Security Assurance Requirements

The requirements for the TOE security assurance are described in Table 17.

<table>
<thead>
<tr>
<th>Assurance Class</th>
<th>Assurance Components</th>
<th>Assurance Components Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Security Target Evaluation</strong></td>
<td>ASE_CCL.1</td>
<td>Conformance claims</td>
</tr>
<tr>
<td></td>
<td>ASE_ECD.1</td>
<td>Extended components definition</td>
</tr>
<tr>
<td></td>
<td>ASE_INT.1</td>
<td>ST introduction</td>
</tr>
<tr>
<td></td>
<td>ASE_OBJ.1</td>
<td>Security objectives for the operational environment</td>
</tr>
<tr>
<td></td>
<td>ASE_REQ.1</td>
<td>Stated security requirements</td>
</tr>
<tr>
<td></td>
<td>ASE_SPD.1</td>
<td>Security Problem Definition</td>
</tr>
<tr>
<td></td>
<td>ASE_TSS.1</td>
<td>TOE Summary Specification</td>
</tr>
<tr>
<td><strong>Development</strong></td>
<td>ADV_FSP.1</td>
<td>Basic functional specification</td>
</tr>
<tr>
<td><strong>Guidance Documents</strong></td>
<td>AGD_OPE.1</td>
<td>Operational user guidance</td>
</tr>
<tr>
<td></td>
<td>AGD_PRE.1</td>
<td>Preparative procedures</td>
</tr>
<tr>
<td><strong>Life-cycle support</strong></td>
<td>ALC_CMC.1</td>
<td>Labelling of the TOE</td>
</tr>
<tr>
<td></td>
<td>ALC_CMS.1</td>
<td>TOE CM coverage</td>
</tr>
<tr>
<td><strong>Tests</strong></td>
<td>ATE_IND.1</td>
<td>Independent testing – Conformance</td>
</tr>
<tr>
<td><strong>Vulnerability assessment</strong></td>
<td>AVA_VAN.1</td>
<td>Vulnerability survey</td>
</tr>
</tbody>
</table>

The rationale for choosing these security assurance requirements is that they define a minimum security baseline that is based on the anticipated threat level of the attacker, the security of the Operational Environment in which the TOE is deployed, and the relative value of the TOE itself.
## 6.4. Security Requirement Rationale

### 6.4.1. Dependencies of Security Functional Requirements

Table 18 describes the functional requirements that security functional requirements depend on and those that do not and the reason why it is not problematic even if dependencies are not satisfied.

6.4.2. Security Assurance Requirements Rationale

The rationale for choosing these security assurance requirements is that they define a minimum security baseline that is based on the anticipated threat level of the attacker, the security of the Operational Environment in which the TOE is deployed, and the relative value of the TOE itself. The assurance activities throughout the ST are used to provide tailored guidance on the specific expectations for completing the security assurance requirements.
7. TOE Summary Specification

This chapter describes the summary specifications of the security functions provided by the TOE.

7.1. Security Functions

Table 19 shows security functional requirements and the corresponding TOE security functions. The security functions described in this section satisfy the TOE security functional requirements specified in section 6.1 of this ST.

Table 19 Security Functional Requirements and the Corresponding TOE Security Functions

7.1.1. Identification and Authentication

The identification and authentication function is the function to identify and authenticate a user by having the user enter a user ID and password from the control panel, EWS and printer driver of the user client so that only certain authorized users are granted permissions to use the functions of the MFD.

User information registered in the MFD is used for identification and authentication.

(1) FIA_AFL.1 Authentication failure handling

The TOE authenticates users before they access the TOE. The TOE has the function to handle authentication failures when a user attempts to be authenticated. This function detects failed local authentication attempts made by the user. When the number of consecutive failed authentication attempts of the user reaches 5, which is set as the maximum allowable number of failures, the TOE does not accept an identification and authentication request of the user until the TOE is turned off and on again.

【Related TSFI】
Identification and authentication of control panel
Identification and authentication of EWS
Printer driver
External audit server

(2) FIA_ATD.1 User attribute definition

FIA_USB.1 User-subject binding
The TOE defines a user ID and a role as attributes for each user and assign the attributes to an identified and authenticated user.

【TSFI related to FIA_ATD.1】
Management functions of control panel
Management functions of EWS

【TSFI related to FIA_USB.1】
Identification and authentication of control panel
Identification and authentication of EWS
External audit server

(3) FIA_PMG_EXT.1 Password Management

In the TOE, when a Key Operator’s password is changed and when the password of a user authenticated by local authentication is newly created or changed, it is possible to create a password by combining the following characters.

Characters that can be used for a password:
Upper- and lower-case letters, numbers, and the following special characters:

"!", "@", "#", "$", "%", "^", ",", ",", ",", ",", ",", ",", ",", ",", ",", ",", ",", ",", ",", ",";

A system administrator can set the required minimum length of the password to a number between 0 to 63. Based on this setting, the TOE can set a lower limit of the password length to 15.

【Related TSFI】
Management functions of control panel
Management functions of EWS

(4) FIA_UAU.1 Timing of authentication
FIA_UID.1 Timing of identification

The TOE supports local authentication as the user identification and authentication method.
There are four types of interfaces that require user identification and authentication: the control panel, web browser of the user client, printer driver, and audit server.
The TOE prompts a user to enter his/her ID and password via a web browser of the user client or the control panel before permitting him/her to operate the MFD function. The entered user ID and password are verified against the user data registered in the TOE.
The audit server prepares a PowerShell script in which system administrators’ IDs and passwords are written, and the script is executed on the audit server. Executing the script sends the IDs and passwords from the audit server to the TOE via https, and the TOE performs identification and authentication using the received IDs and passwords.
When Store Print is performed, identification and authentication are performed based on the ID and password assigned to the print data sent from the client computer.
The identification (FIA_UID.1) and authentication (FIA_UAU.1) are simultaneously performed, and the operation on the TOE is allowed only when both identification and authentication succeed.

**Related TSFI**
- Identification and authentication of control panel
- Identification and authentication of EWS
- Printer driver
- External audit server

(5) **FIA_UAU.7 Protected authentication feedback**
The TOE provides the function to display the same number of symbols* as the password characters entered on the control panel or web browser in order to hide the password at the time of user authentication.

* Asterisks (*) and bullets (●) are displayed on the control panel and the web browser respectively.

**Related TSFI**
- Identification and authentication of control panel
- Identification and authentication of EWS

(6) **FTA_SSL.3 TSF-initiated termination**
The TOE clears the login information (authentication session) and prompts a user to re-authenticate if EWS has not been accessed from a web browser for a specified period of time (fixed in 20 mins).
In addition, when there is no operation from the control panel for a specified period of time (the settable time ranges from 10 to 900 seconds), the setting on the control panel is cleared and the screen returns to the authentication screen.
The session with the printer driver is not retained. The session ends immediately after a print request is processed.

**Related TSFI**
- Identification and authentication of control panel
- Identification and authentication of EWS

### 7.1.2. Security Audit

The security audit function offers a means to track and log the activities of all TOE users (when and who carried out which actions) and important events (device failure, configuration change, user operation, etc.) according to the Security Audit Log setting configured by a system administrator in system administrator mode.

(1) **FAU_GEN.1 Audit data generation**
FAU_GEN.2 User identity association

The TOE records auditable events shown in Table 20, such as job completion, failed user identification and authentication attempts, and use of security management functions by identified and authenticated users, in the audit log. The date and time when the event occurred, the type of the event, the user who caused the event (if known), and the result of the event are recorded in the audit data of each event.

When the TOE records a defined auditable event in the audit log file, the TOE associates the event with the identification information of the user who caused the event.

[“Mailbox” means a storage and retrieval job.]
(2) FAU_SAR.1 Audit review
   After logging in to the EWS, the system administrator can read all the information recorded in the security audit log data by using the EWS. Security audit log data is downloaded as a tab-delimited text file. When downloading the security audit log data, TLS communication must be enabled.

   【Related TSFI】
   Management functions of EWS

(3) FAU_SAR.2 Restricted audit review
   The function to read the security audit log data is restricted to the authenticated system administrator. Also, the security audit log data can be accessed only from the web browser and cannot be accessed from the control panel.

   【Related TSFI】
   Management functions of EWS

(4) FAU_STG.1 Protected audit trail storage
   Access to the security audit log data is for reading only, there is no delete or modify function. This protects the security audit log data from unauthenticated deletion and modification.

   【Related TSFI】
   Management functions of EWS

(5) FAU_STG.4 Prevention of audit data loss
   The audit log target events are stored in the storage device in the TOE internally. The storage device can store up to 15,000 events. When the security audit log data becomes full, the oldest recorded audit data is overwritten and new audit data is recorded without loss.

   【Related TSFI】
   Identification and authentication of control panel
   Identification and authentication of EWS
   Printer driver
   Management functions of control panel
   Management functions of EWS

Job management and log display functions of control panel
Function of EWS to display the JOB status and log
Function of EWS to retrieve document data from Mailbox
Function of EWS to print designated files
External audit server
Firmware update function of EWS

(6) FAU_STG_EXT.1 Extended: External Audit Trail Storage
The security audit log data is sent to an external audit server as a tab-delimited text file by the request from the server. When an external audit server requests the TOE to send the security audit log data, the TOE sends all stored data to the server. When sending to an external audit server, the data is encrypted with TLS/HTTPS. Only authenticated system administrators can retrieve security audit log data. The maximum number of audit log target events temporarily stored in the TOE internally and the behavior when the events exceed the maximum number are described in (5) FAU_STG.4.

[Related TSFI]
External audit server

(7) FPT_STM.1 Reliable time stamps
The TOE provides the function to issue the time stamp using TOE’s clock function when the defined auditable event is recorded in the audit log file. As specified in FMT_MTD.1, only system administrators can change the clock setting.

[Related TSFI]
Follow the related TSFI of FAU_GEN.1, FAU_GEN.2

7.1.3. Access Control

Only the authenticated and identified user can use the following functions. Available functions depend on the interface that accesses the TSF.

a) Functions controlled by the MFD control panel
Copy, store file, scan, document storage and retrieval, print (This print function requires the Accounting System preset on printer driver. A user must be authenticated on the control panel.), device condition display, job status and log display, and referring to / changing the TOE setting data (system administrators only)

b) Functions controlled by EWS
Device condition display, job status and log display, function to retrieve document data from Mailbox, print function by file designation, and referring to / changing the TOE setting data (system administrators only), and firmware update function (only system administrator)
c) Functions that use the printer driver of the user client

When a user sends a print request from the printer driver of the user’s client in which the Accounting System is preset, the MFD decomposes the received data into bitmap data and stores the data in the internal HDD as private print according to the user ID if the identification and authentication are successful.

(1) FDP_ACC.1 Subset access control

FDP_ACF.1 Security attribute based access control

The TOE controls access to the jobs and document data of each basic function in accordance with Tables 11 and 12. For the notes in brackets at the ends of the following sentences, refer to the notes of Tables 11 and 12.

The user who started each function is assigned as the owner of the job and document data of the function and only the owner or system administrators can access the job and document data.

Regarding the print function, a user ID, which will be used to identify the user of the function, is included in the print data sent by the client computer. The owner of the print job is identified with the user ID (note 1).

Regarding scan, copy, and store file functions’ jobs, the user associated with the user ID that is used to log in on the control panel is assigned as the job owner (note 2).

The document storage and retrieval function enable to store/retrieve scanned documents or “store file documents” to/from the Mailbox. Regarding the scan function and store file function, the user must be logged in beforehand. When a user stores scanned documents (or “store file documents”) in a Mailbox, the Key Operator can select a Mailbox from all Mailboxes, while a general user and SA can only select the user’s own Mailbox. After selecting the Mailbox to store scanned documents (or “store file documents”), the user scans (or store file) the documents. The user who owns the selected Mailbox becomes the owner of the scanned documents (or “store file documents”) (note 1). Only the owner of the data stored in the Mailbox or the Key Operator can retrieve, print (and select the number of copies and the paper size) and delete the stored data. However, the data stored by “store file” function can not be retrieved even by the owner or the Key Operator. Although SAs are included in system administrators, they cannot access the data in the Mailboxes of other users. Also, when using the On Demand Overwrite function, the administrator can delete the data stored in Mailboxes by specifying the time or manually (note 3). Further, the owner of “store file documents” can edit (“merge”, “Insert slip sheet”, “delete page”) the “store file documents” by operating the control panel. However, scanned documents can not be edited even by the owner (note 4). The Key Operator can edit all “store file documents” by operating the control panel. SAs can only edit their own “store file documents”. However, scanned documents can not be edited by either the Key Operator or the SA (note 5). The print, scan, and copy functions do not provide the function of editing document data.

The function to modify the scan jobs is not provided.

【Related TSFI】
Printer driver  
Copy, store file, print, scan, fax, scanned document storage to Mailbox, and document retrieval functions of control panel  
Function of control panel to display the job status and log  
Function of EWS to display the job status and log

Function of EWS to print designated files  

7.1.4. Security management  

(1) FMT_MOF.1 Management of security functions behavior  
FMT_MTD.1 Management of TSF data  
FMT_SMF.1 Specification of Management Functions  
FMT_MSA.1 Management of security attributes  
FMT_MSA.3 Static attribute initialization  
FMT_SMR.1 Security roles  

The TOE provides identified and authenticated system administrators with user interfaces to refer to and change settings of security management functions shown in Table 21 that are related to the TOE security functions and to customize detailed settings of each function.  
Identified and authenticated general users can only change their own passwords.  
As shown above, the required security management functions are satisfied.  
As in Table 11 and Table 12, the TOE sets the ID of the user who started each basic function as the default value of the ID of the owner of the job and document data of each function. For details, refer to “7.1.3. Access Control (1) FDP_ACC.1 Subset access control FDP_ACF.1 Security attribute based access control.”  
The TOE associates the roles of the Key Operator, SA, system administrator, and general user to the legitimate users and maintains the association.  
In the TOE, the default value of the user role, which is a security attribute, is the general user.

*1) When both control panel and EWS are enabled, firmware update function is enabled. When either control panel or EWS is enabled, firmware update function is not enabled.

(2) FPT_SKP_EXT.1 Protection of TSF Data

The TOE stores a KEK (Key Encryption Key) in plaintext in NVRAM2, but the TOE does not provide an interface to read the KEK to any users. The circuit board which NVRAM2 is soldered to is not for storage.

A DEK (Data Encryption Key) is encrypted with KEK in AES-CBC and is stored in NVRAM1 and HDD. The one in HDD is a backup.

When the TOE is turned on, the encrypted DEK stored in NVRAM1 is decrypted with a KEK stored in NVRAM2. While the TOE is in operation, the DEK is stored in DRAM in plaintext. The TOE does not provide an interface to read the plaintext DEK stored in DRAM to any users. The plaintext DEK stored in DRAM is destroyed when the TOE is turned off.

Certificates with secret keys used for TLS communications, etc. are encrypted with the mechanism described in 7.1.6 (15) and stored in the NVRAM1. The interface to read the secret keys is not provided to any users.

The TLS session key and TLS EC Diffie-Hellman secret key used for communication are stored in the DRAM in plaintext, but the interface to read the plaintext session keys stored in the DRAM is not provided to any users. The plaintext session key is destroyed when the TOE is turned off.

【Related TSFI】
None

7.1.5 Trusted Operation

(1) FPT_TST_EXT.1 TSF testing

Testing of TSF image:

The TSF consists of Controller+PS ROM. Verification of the integrity of this firmware guarantees the proper operation of the TSF.

When the TOE is turned on, Controller+PS ROM calculates 4 bytes checksum to verify whether the checksum match the specified value. When an error occurs, an error message is displayed on the control panel, and the TOE cancels the startup. The TOE operates health tests described in [1]11.3 on the DRBG. When the test is failed, the TOE displays an error message on the control panel and cancels the startup. The specifications of the DRBG is described in 7.1.6.

【Related TSFI】
Power button (when the TOE is turned on and off)
The system administrators can see the current version of the firmware that configures the TOE on the control panel by operating it or on paper by printing the configuration report. Only identified and authenticated system administrators can update the firmware by sending a binary file that contains Controller+PS ROM to the TOE from the web browser of a system administrator’s client computer.

When the TOE receives a binary file that contains firmware sent from the web browser of a system administrator’s client computer, the TOE verifies the digital signature attached to the binary file. When the verification fails, the update is cancelled, an error message is displayed on the control panel, and the TOE stops. The digital signature attached to the binary file is a RSA-PKCS1-v1.5 digital signature that is made by hashing the binary file with SHA-256 and encrypting the hash value with a 2048-bit secret key. Therefore, in order to verify the digital signature, 1) decrypt the digital signature attached to the binary file with the RSA public key for firmware signature verification, 2) hash the binary file with SHA-256, and 3) compare the decrypted value and the hash value. When the two values are the same, verification is successful and if not, verification is failed.

7.1.6. Data Encryption

(1) FCS_CKM.1(a) Cryptographic Key Generation (for asymmetric keys)

An elliptic curve key described in [2] is used as the asymmetric key for the key establishment (EC Diffie-Hellman) in TLS encrypted communication. Methods to generate an elliptic curve key shall follow [3] 5.6.1.2.2 and [2] Appendix B.4.2. TLS EC Diffie-Hellman secret key is a random number generated by AES-256 CTR DRBG described in (14) seeded with values generated by Linux /dev/random. Supported elliptic curves are P-256, P-384, and P-521 as described in [2] Appendix D, and the elliptic curve to be used is decided in TLS negotiation.

The TOE uses an elliptic curve key described in [2] or an RSA key described in [4] as the asymmetric key for the TLS server certificate. These asymmetric keys are generated on the user request from EWS. Methods to generate an elliptic curve key shall follow [3] 5.6.1.2.2 and [2] Appendix B.4.2. Methods to generate an RSA key shall follow [4] 6.3.1.3.
The prime number used in the procedure shall be generated following [2] B.3.6. Supported elliptic curves are P-256, P-384, and P-521 as described in [2] Appendix D, and supported RSA key sizes are 2048-bit and 3072-bit. The user selects one and requests to generate a key on EWS. AES-256 CTR DRBG described in (14) is used to generate random probable primes.

The TOE does not make any changes to the above key generation methods and does not use any other methods.

【Related TSFI】
Identification and authentication of EWS

Firmware update function of EWS

(2) FCS_CKM.1(b) Cryptographic Key Generation (symmetric keys)
The TOE uses random numbers that consist of arbitrary number of bits for the DEK and the session keys for trusted communications. Specifically, a 256-bit number for the DEK, a 256-bit number for the KEK to encrypt the DEK, a 128 to 256-bit number (depends on the encryption method decided in the negotiation) for the master key of TLS session keys are generated. For random number generation, AES-256 CTR DRBG described in (14) is used. The DRBG is called when the key chain described in (12) is generated and when the TLS communication session starts.

External audit server
Firmware update function of EWS

(3) FCS_CKM.4 Cryptographic key destruction
FCS_CKM_EXT.4 Cryptographic Key Material Destruction
The TOE destroys plaintext keys and key materials when they are no longer needed (*). Table 22 shows keys and key materials that are stored in the TOE in plaintext and how they are destroyed. The values of these keys and materials are copied to the working memory of RAM and used when an encryption is performed. The copied data on RAM is deleted when the TOE is turned off because it is no longer needed.

(*) The DEK is stored in NVRAM1 and HDD, but it is not destroyed because it is encrypted as described in (10). The asymmetric key for TLS server certificate described in (1) is stored in the NVRAM1, but it is not destroyed because it is encrypted with the mechanism described in (15). The public key used for the verification of firmware signature is not destroyed because it is not classified as any of the following: secret key, private cryptographic key, or cryptographic critical security parameter.

【Related TSFI】
Management functions of control panel
Power button (when the TOE is turned on and off)

(4) FCS_COP.1(a)  Cryptographic Operation (Symmetric encryption/decryption)
The TOE supports AES-CBC described in [5] and AES-GCM (128-bit and 256-bit) described in [6] for the symmetric encryption/decryption of TLS. AES follows [7].

【Related TSFI】
Identification and authentication of EWS

Firmware update function of EWS

(5) FCS_COP.1(b1)  Cryptographic Operation (for signature generation/verification)
The TOE supports RSA digital signature described in [2] for the verification of the authenticity of the firmware update. The key size is 2048-bit. The format of the signature follows RSASSA-PKCS1-v1.5 described in [2] 5.5 (f).

【Related TSFI】
Firmware update function of EWS

(6) FCS_COP.1(b2)  Cryptographic Operation (for signature generation/verification)
When verifying the target of TLS communication and digital signature generation/verification, the TOE generates RSA digital signatures and elliptic curve digital signatures described in [2] and verifies with them. Supported RSA key sizes are 2048-bit and 3072-bit. Supported NIST elliptic curves are P256, P384, and P521. The format of the RSA digital signature follows RSASSA-PKCS1-v1.5 described in [2] 5.5 (f). The methods of generation and verification of the elliptic curve digital signature follows [2] 6.4. For these, the signature methods to be used are determined respectively by negotiation with the communication partner during TLS communication, and by the user’s specification at the time of digital signature generation.

【Related TSFI】
Management functions of EWS
Scan function of control panel

(7) FCS_COP.1(c1)  Cryptographic operation (Hash Algorithm)
The TOE uses SHA-256 for the hash calculation of firmware update image data when verifying the authenticity of the firmware update. The TOE compares the SHA-256 hash value and the value of the signature decrypted with RSA to verify the signature. The hash algorithm follows [8].

【Related TSFI】
Firmware update function of EWS

(8) FCS_COP.1(c2)  Cryptographic operation (Hash Algorithm)
The TOE supports SHA1/SHA256/SHA384 for the hash calculation of keyed-hash message authentication method described in (11). The hash algorithm used for communication is determined by negotiation with the communication partner. In addition, the TOE supports SHA256/SHA384/SHA512 for hash calculation for digital signature generation/verification, and the hash algorithm to be used determined by user’s specification at the time of signature generation.
The hash calculation of keyed-hash message authentication method in TLS and the hash calculation of digital signature generation/verification are independent and can be freely combined.

(9) FCS_COP.1(d) Cryptographic operation (AES Data Encryption/Decryption)
The TOE supports AES described in [9] as the encryption method of the storage encryption and supports CBC described in [10] as the block cipher mode. The key size is 256-bit. The sector number of the storage and the DEK are used to calculate the IV.

【Related TSFI】
Printer Driver
Copy, store file, print, scan, fax, scanned document storage to Mailbox, and document retrieval functions of control panel
Job status and log display of control panel
Function of EWS to retrieve document data from Mailbox
Function of EWS to print designated files

(10) FCS_COP.1(f) Cryptographic operation (Key Encryption)
As described in (12), the TOE encrypts DEK (256-bit) using AES described in [9]. The key size is 256-bit. Supported block cipher mode is CBC described in [10]. IV is a random number generated by AES-256 CTR DRBG described in (14).

【Related TSFI】
Power button (when the TOE is turned on and off)

(11) FCS_COP.1(g) Cryptographic Operation (for keyed-hash message authentication)
The TOE supports the following for the keyed-hash message authentication of TLS.
- Key size (bit): 160, 256, and 384
- Hash: SHA-1, SHA-256, and SHA-384
- Message digest size (bit): 160, 256, and 384
The hash algorithm follows [11], and the keyed-hash message authentication algorithm (HMAC) follows [12].

【Related TSFI】

Print driver
Management functions of EWS
Scan function of control panel
Function of EWS to display the JOB status and log
Function of EWSto retrieve document data from Mailbox
Function of EWS to print designated files
External audit server
Firmware update function of EWS

(12) FCS_KYC_EXT.1  Key Chaining
In the TOE, the DEK and the KEK, which encrypts the DEK, are in a key chain. When the
TOE is turned on without DEK chain (more specifically, when the TOE is turned on for the
first time in the factory, or when the TOE is turned on for the first time after batch
deletion of data is performed from the system administrator menu on the control panel),
the TOE generates the DEK and KEK using DRBG described in (14). The DEK is encrypted
with KEK as described in (10) and stored in NVRAM1 and HDD, and the KEK is stored in
NVRAM2 in plaintext. When the TOE is turned on subsequently, the TOE decrypts the
encrypted DEK stored in NVRAM1 with the KEK retrieved from NVRAM2 as described in
(10). The key size of both DEK and KEK is 256-bit. As described in (14), DRBG supplies
sufficient entropy, so the strength of both DEK and KEK is 256-bit, which means that the
256-bit strength is maintained in the key chain.

【Related TSFI】
Power button (when the TOE is turned on and off)

(13) FPT_KYP_EXT.1  Protection of Key and Key Material
As described in (12), when the TOE is turned on for the first time without DEK chain, the
TOE generates a DEK and a KEK using DRBG described later, stores the DEK encrypted
with KEK in NVRAM1 and HDD, and stores the KEK in NVRAM2 in plaintext. The DEK and
KEK are not stored in other storage. NVRAM2 is not a Field-Replaceable Nonvolatile
Storage Device, so plaintext keys that are part of the keychain specified by (12) is not
stored in any Field-Replaceable Nonvolatile Storage Device.

【Related TSFI】
Power button (when the TOE is turned on and off)

(14) FCS_RBG_EXT.1  Cryptographic Operation (Random Bit Generation)
For random number generation, the TOE uses AES-256 CTR DRBG that follows [1]10.2.1.
This DRBG has derivation function and reseed function, but does not have prediction
resistance function. It uses a random number generated by Linux kernel /dev/random as
the seed. Linux Random Number Generator (LRNG), which provides /dev/random, and the
read noise of the clock counter, which is input in LRNG, are included in the entropy pool
of DRBG. The noise is created by a software so that the clock counter reads at random
timings. DRBG uses the seed provided by /dev/random as the entropy input and nonce,
but the amount of entropy is more than 256-bit × 1.5, which is sufficient according to [1]
8.6.7.
The TOE generates the DEK and the master key of TLS session keys using the DRBG.

Function of EWS to display the JOB status and log
Function of EWS to retrieve document data from Mailbox
Function of EWS to print designated files
External audit server
Firmware update function of EWS

(15) FDP_DSK_EXT.1 Protection of Data on Disk
The TOE encrypts/decrypts each data block in the storage device.

More precisely, for the storage device partition that is to be encrypted, the TOE applies
data decryption/encryption through the read/write operation of a file or metadata, and
reads/writes data blocks from/to that partition.

Encryption method follows FCS_COP.1(d). The storage devices containing the encryption
target partition are field-replaceable HDD and NVRAM1. There are no field-replaceable
devices except for the HDD and NVRAM1.
The encryption/decryption described above starts to be performed when the TOE is
turned on. As described in (12), the DEK to be used for encryption/decryption is generated
when the TOE is turned on without an cryptographic key chain.
All plaintext user data and plaintext secret TSF data are encrypted because they are
written in the partitions to be encrypted on the HDD and NVRAM1. The partitions not to
be encrypted on the HDD and NVRAM1 store only program images, control parameters,
and the DEK encrypted with KEK in the method specified in (10). Plaintext user document
data and plaintext secret TSF data is not stored in those partitions. As described in (12),
the DEK is encrypted when the TOE is turned on without a cryptographic key chain.
NVRAM2, which stores the plaintext KEK, is not a field-replaceable storage device.

Function of EWS to print designated files

7.1.7. Trusted Communications

(1) FCS_HTTPS_EXT.1 HTTPS selected
There is a setting that forces a secure channel using HTTPS for all communication traffic of the TOE with the web browser and audit server. Only system administrators can change this setting, and it is performed on EWS. The specifications of HTTPS follow [13]. When the TOE receives a request to connect to EWS from the web browser of a client computer, the TOE and the client computer establish the TLS negotiation and start HTTPS communication. Identification, authentication, and all remote operation on the TOE through EWS of the client computer are performed via HTTPS communication. When the audit server requests to retrieve the security audit log data, the TOE sends the data to the audit server via HTTPS communication.

Firmware update function of EWS

(2) FCS_TLS_EXT.1 TLS selected
The supported TLS communication is TLS 1.2 described in [14]. The cipher suite to be used in the TLS communication is negotiated while the client and server are connected with TLS. In TLS communication, the TOE can be a client or a server depending on the function in operation. For example, the TOE acts as a server when accessing EWS. The TOE acts as a client when sending scanned documents via email. The TOE selects an appropriate cipher suite that the TOE supports from the cipher suites suggested by the client. Cipher suites supported by the TOE are as follows:

- TLS_RSA_WITH_AES_128_CBC_SHA
- TLS_RSA_WITH_AES_256_CBC_SHA
- TLS_RSA_WITH_AES_128_CBC_SHA256
- TLS_RSA_WITH_AES_256_CBC_SHA256
- TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA
- TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA
- TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256
- TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384
- TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
- TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA
- TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA
- TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
- TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384

(3) FTP_ITC.1  Inter-TSF trusted channel
The TOE supports the following trusted communication protocols for the communication of the TOE with the audit server and the mail server. This ensures identification of the end points and protection of the channel data from disclosure and modification.
- Audit server: TLS/HTTPS
- Mail server: TLS

【Related TSFI】
Scan function of control panel
External audit server

(4) FTP_TRP.1(a)  Trusted path (for Administrators)
The TOE supports the following trusted communication protocols for each interface to access the TOE from the remote computers of system administrators. This ensures identification of the TOE’s end points and protection of the channel data from disclosure and modification.
- EWS: TLS/HTTPS

【Related TSFI】
Identification and authentication of EWS
Management functions of EWS
Function of EWS to display the JOB status and log
Function of EWS to retrieve document data from Mailbox
Function of EWS to print designated files
Firmware update function of EWS

(5) FTP_TRP.1(b) Trusted path (for Non-administrators)
The TOE supports the following trusted communication protocols for each interface to access the TOE from the remote computers of non-administrators. This ensures identification of the TOE’s end points and protection of the channel data from disclosure and modification.
- EWS: TLS/HTTPS
- Printing with the printer driver: TLS

7.1.8. Overwrite Hard Disk

(1) FDP_RIP.1(a) Subset residual information protection
When the Overwrite Hard Disk is enabled to be conducted after each job by a system administrator, the TOE overwrites the used document data stored in the internal HDD after each job of copy, print, and scan is finished.
The document data used by the document storage function is deleted when an operation to print, retrieve or delete the data from mailbox is carried out. After that, the TOE overwrites the data.
This TOE provides the On Demand Overwrite function that deletes various stored documents and stored print documents in Mailboxes at the time set by the system administrator or manually. The data related to deleted stored documents is overwritten based on the setting of the Overwrite Hard Disk.
Overwrite Hard Disk has two options: one pass overwrite procedure (overwrite with zero) and three pass overwrite procedure (overwrite with zero / one / random number and verification). However, when the storage encryption function is enabled, the data for overwrite (zero / one / random number) to be physically written to the storage is encrypted. A list of used document data to be overwritten and deleted is on the internal HDD, and the TOE checks the list when it is turned on. If used document data that has not been deleted is found on the list, Hard Disk Data Overwrite is performed.

8. ACRONYMS AND TERMINOLOGY

8.1. Acronyms

The following acronyms are used in this ST:

<table>
<thead>
<tr>
<th>Acronym</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>Common Criteria</td>
</tr>
<tr>
<td>EWS</td>
<td>Embedded Web Server</td>
</tr>
<tr>
<td>DRAM</td>
<td>Dynamic Random Access Memory</td>
</tr>
<tr>
<td>FIPS PUB</td>
<td>Federal Information Processing Standard publication</td>
</tr>
<tr>
<td>IIT</td>
<td>Image Input Terminal</td>
</tr>
<tr>
<td>IOT</td>
<td>Image Output Terminal</td>
</tr>
<tr>
<td>MFD</td>
<td>Multi Function Device</td>
</tr>
<tr>
<td>NVRAM</td>
<td>Non Volatile Random Access Memory</td>
</tr>
<tr>
<td>PDL</td>
<td>Page Description Language</td>
</tr>
<tr>
<td>PP</td>
<td>Protection Profile</td>
</tr>
<tr>
<td>SEEPROM</td>
<td>Serial Electronically Erasable and Programmable Read Only Memory</td>
</tr>
<tr>
<td>SFP</td>
<td>Security Function Policy</td>
</tr>
<tr>
<td>SFR</td>
<td>Security Functional Requirement</td>
</tr>
<tr>
<td>SMTP</td>
<td>Simple Mail Transfer Protocol</td>
</tr>
<tr>
<td>ST</td>
<td>Security Target</td>
</tr>
<tr>
<td>TOE</td>
<td>Target of Evaluation</td>
</tr>
<tr>
<td>TSF</td>
<td>TOE Security Function</td>
</tr>
</tbody>
</table>

8.2. Terminology

The following terms are used in this ST:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destruction</td>
<td>Destruction is to delete the target so that the location of the target cannot be traced from the file system and volatile memory. Overwriting of the storage of the target is not included in destruction.</td>
</tr>
<tr>
<td>KEK</td>
<td>Abbreviation of Key Encryption Key. In this ST, KEK is a cryptographic key to encrypt the DEK.</td>
</tr>
<tr>
<td>Term</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DEK</td>
<td>Abbreviation of Data Encryption Key. In this ST, DEK is a cryptographic key for storage.</td>
</tr>
<tr>
<td>Flash memory</td>
<td>SD or eMMC.</td>
</tr>
<tr>
<td>Storage</td>
<td>Non-volatile flash memory or HDD.</td>
</tr>
<tr>
<td>SEEP</td>
<td>Abbreviation of Serial Electrically Erasable PROM. A non-volatile flash memory that is connected to the CPU on the controller board.</td>
</tr>
<tr>
<td>Web UI</td>
<td>A service that allows users to control the TOE through the web browser of the user client.</td>
</tr>
<tr>
<td>Mailbox</td>
<td>A location to store scanned documents and “store file documents”. Computers on the network can retrieve the stored documents from the Mailbox.</td>
</tr>
<tr>
<td>Store Print</td>
<td>A print function that temporarily stores bitmap data (decomposed print data) in the internal HDD of the MFD and then print out in accordance with the authenticated user’s instruction from the control panel.</td>
</tr>
<tr>
<td>Used document data</td>
<td>The remaining data in the internal HDD of the MFD after deletion. After a document stored in the internal HDD is used, only its file is deleted, and the data inside remains.</td>
</tr>
<tr>
<td>Document data</td>
<td>A collective term for all the data, including image data, transmitted across the MFD when any of copy, print, scan, or document storage functions is used by a general user (U.NORMAL) or an SA.</td>
</tr>
<tr>
<td>Scanned document</td>
<td>The document data converted into digital format by “Scan” function. This TOE has the function to send a scanned document to a mailserver and to store it in the Mailbox by “Document storage and retrieval” function.</td>
</tr>
<tr>
<td>Store file document</td>
<td>The document data converted into digital format by “Store File” function. This TOE has the function to store a “store file document” in a Mailbox by “Document storage and retrieval” function.</td>
</tr>
<tr>
<td>Security audit log data</td>
<td>The chronologically recorded data of auditable events including important events of the TOE, such as device failure, configuration change, and user operation. These events are traced and recorded based on when and who operated what function.</td>
</tr>
<tr>
<td>User role</td>
<td>A role assigned to an identified and authenticated user. The TOE defines the Key Operator role, SA role, and general user role.</td>
</tr>
<tr>
<td>Key Operator role</td>
<td>The authority required for the Key Operator to use the TOE.</td>
</tr>
<tr>
<td>SA role</td>
<td>The authority required for an SA to use the TOE.</td>
</tr>
<tr>
<td>U.NORMAL role</td>
<td>The authority required for a general user (U.NORMAL) to use the TOE.</td>
</tr>
<tr>
<td>User identifier</td>
<td>Information to identify users. User ID.</td>
</tr>
<tr>
<td>Key Operator identifier</td>
<td>A user ID with the Key Operator role.</td>
</tr>
<tr>
<td>Key Operator</td>
<td>An authorized user who maintains the MFD and performs settings of the security functions of the TOE.</td>
</tr>
<tr>
<td>SA</td>
<td>An authorized user who maintains the MFD and performs settings of the security functions of the TOE. An SA account is created by the Key Operator or an SA who is already registered.</td>
</tr>
<tr>
<td>U.ADMIN</td>
<td>A collective term for Key Operator and SA.</td>
</tr>
<tr>
<td><strong>EWS (Embedded Web Server)</strong></td>
<td>EWS is a service that allows the user to access the TOE via the web browser of the client computer. The user can confirm the status of the TOE, change settings of the TOE, and request retrieval and printing of documents. EWS operates on a standard web browser of Windows.</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>User authentication</strong></td>
<td>A function to identify the user before he/she uses each TOE function so that the TOE can limit the access to the TOE functions. User authentication has two modes (local authentication and remote authentication). The TOE uses local authentication.</td>
</tr>
<tr>
<td><strong>Local Authentication</strong></td>
<td>A mode to perform user authentication of the TOE using the user information registered in the MFD.</td>
</tr>
<tr>
<td><strong>Remote Authentication</strong></td>
<td>A mode to perform user authentication of the TOE using the user information registered in the external authentication server.</td>
</tr>
<tr>
<td><strong>Overwrite Hard Disk</strong></td>
<td>A function to delete document data stored in the HDD by writing over the area of the data with certain data.</td>
</tr>
<tr>
<td><strong>Storage data encryption</strong></td>
<td>A function to encrypt the storage that stores some of the assets under protection.</td>
</tr>
<tr>
<td><strong>Decompose function</strong></td>
<td>A function to analyze the data written in PDL and convert the data into bitmap data.</td>
</tr>
<tr>
<td><strong>Decompose</strong></td>
<td>The action of analyzing the data written in PDL and converting the data into bitmap data by using the decompose function.</td>
</tr>
<tr>
<td><strong>System administrator mode</strong></td>
<td>An operation mode that enables a system administrator to refer to and rewrite TOE device operation settings and security function settings in order to adjust those settings in accordance with the operational environment. System administrator mode is distinguished from the operation mode that enables a general user to use the MFD functions.</td>
</tr>
<tr>
<td><strong>Auto Clear</strong></td>
<td>A function to automatically log out after a specified period of time passes without any operations performed on the control panel or EWS.</td>
</tr>
<tr>
<td><strong>Customer Engineer</strong></td>
<td>Customer service engineer, an engineer who maintains and repairs the MFD.</td>
</tr>
<tr>
<td><strong>Attacker</strong></td>
<td>A person who accesses the TOE or protected property by unauthorized means. Includes users who attempt access by disguising themselves as authenticated users.</td>
</tr>
<tr>
<td><strong>Control panel</strong></td>
<td>A panel on which buttons, lamps, and a touch-screen display, which are necessary for MFD operations, are arranged.</td>
</tr>
<tr>
<td><strong>General user client</strong></td>
<td>A client for a general user.</td>
</tr>
<tr>
<td><strong>System administrator client</strong></td>
<td>A client for a system administrator. A system administrator can refer to and change the TOE setting data of the MFD via web browser.</td>
</tr>
<tr>
<td><strong>Printer driver</strong></td>
<td>A software to convert the data on a general user client into print data written in page description language (PDL), a readable format for MFD. Used on the user client.</td>
</tr>
<tr>
<td><strong>Print data</strong></td>
<td>The data written in PDL, a readable format for MFD. Print data is converted into bitmap data by the decompose function of the TOE.</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Bitmap data</strong></td>
<td>The decomposed data of the data read by the copy function and the print data transmitted sent by the print function from a user client to MFD. Bitmap data is stored to the internal HDD after being compressed in a unique process.</td>
</tr>
<tr>
<td><strong>Original document</strong></td>
<td>Texts, images and photos to be read on IIT by the copy function.</td>
</tr>
<tr>
<td><strong>TOE setting data</strong></td>
<td>The data created by the TOE or for the TOE and may affect the TOE security functions. Included in the TSF data.</td>
</tr>
<tr>
<td><strong>Cryptographic key</strong></td>
<td>256-bit data which is automatically generated. When document data is stored to the storage device, it is encrypted with the cryptographic key.</td>
</tr>
<tr>
<td><strong>Network</strong></td>
<td>A general term to indicate both external and internal networks.</td>
</tr>
<tr>
<td><strong>External network</strong></td>
<td>The network which cannot be managed by the organization that manages the TOE. This does not include the internal network.</td>
</tr>
<tr>
<td><strong>Internal network</strong></td>
<td>Channels between the MFD and the trusted remote servers and client computers. The channels are located in the network of the organization that owns the TOE. The network is protected from the security risks coming from the external network.</td>
</tr>
<tr>
<td><strong>Certificate</strong></td>
<td>Defined in ITU-T recommendation X.509. A certificate includes the data for user authentication (name, distinguished name, organization which the user belongs to, etc.), public key, expiry date, serial number, signature, etc.</td>
</tr>
<tr>
<td><strong>Data on minimum user password length</strong></td>
<td>Minimum user password length to set the user password on the MFD control panel.  Included in the TOE setting data.</td>
</tr>
<tr>
<td><strong>Key Operator password</strong></td>
<td>Password data for Key Operator authentication. Included in the TOE setting data.</td>
</tr>
<tr>
<td><strong>SA password</strong></td>
<td>Password data for SA authentication. Included in the TOE setting data.</td>
</tr>
<tr>
<td><strong>U.Normal password</strong></td>
<td>Password data for general user (U.NORMAL) authentication. Included in the TOE setting data.</td>
</tr>
<tr>
<td><strong>Data on access denial due to authentication failures</strong></td>
<td>The data on whether to enable/disable access denial due to authentication failure. They also incorporate the data on the allowable number of the failures before access denial. Included in the TOE setting data.</td>
</tr>
<tr>
<td><strong>Data on auditing</strong></td>
<td>The data on whether to enable/disable the function to trace/record auditable events including important events of the TOE, such as device failure, configuration change, and user operation based on when and who operated what function. Included in the TOE setting data.</td>
</tr>
<tr>
<td><strong>Data on user authentication</strong></td>
<td>The data on whether to enable/disable the authentication function. The authentication function is performed using the user authentication information when copy, scan, and print functions of MFD are performed. It also incorporates the data on the authentication method. Included in the TOE setting data.</td>
</tr>
<tr>
<td>Data on use of password entered from MFD control panel in user authentication</td>
<td>The data on whether to enable/disable the use of password when the user authentication is performed on the control panel. Included in the TOE setting data.</td>
</tr>
<tr>
<td>---</td>
<td></td>
</tr>
<tr>
<td>Data on Store Print</td>
<td>The setting data on whether to store the received print data to Private Print area or print it out. Included in the TOE setting data.</td>
</tr>
<tr>
<td>Data on trusted communications</td>
<td>Data on whether the general encrypted communication protocols (TLS/HTTPS and TLS) are enabled/disabled and their detailed settings and certificate, authentication passwords, encryption keys, and shared keys to protect communication data in the internal network such as document data, job information, security audit log data, and TOE setting data. Included in the TOE setting data.</td>
</tr>
<tr>
<td>Data on Customer Engineer operation restriction</td>
<td>The data on whether to enable/disable the Customer Engineer Operation Restriction function and the data on the maintenance password. Included in the TOE setting data.</td>
</tr>
<tr>
<td>Data on Overwrite Hard Disk</td>
<td>The data on whether to enable/disable the functions related to Overwrite Hard Disk. Included in the TOE setting data.</td>
</tr>
<tr>
<td>Data on storage data encryption</td>
<td>The data on whether to enable/disable the functions related to storage data encryption. Included in the TOE setting data.</td>
</tr>
<tr>
<td>Data on date and time</td>
<td>The time zone / summer time information and the present time data. Included in the TOE setting data.</td>
</tr>
<tr>
<td>Data on Auto Clear</td>
<td>The data on whether to enable/disable the functions of Auto Clear and the timing to clear on the control panel / Embedded Web Server. Included in the TOE setting data.</td>
</tr>
<tr>
<td>Data on Self Test</td>
<td>The data on whether to enable/disable the Self Test function. Included in the TOE setting data.</td>
</tr>
<tr>
<td>Data on Report Print</td>
<td>The data on whether to enable/disable the Report Print function. Included in the TOE setting data.</td>
</tr>
<tr>
<td>Data on Firmware update</td>
<td>The setting data on firmware update functions. Setting data of Firmware Update. Included in the TOE setting data.</td>
</tr>
